>and personally, you seem to have some good thoughts, but watch the name calling
>and stuff. Remember that it is just a hobby, and the F.C.C. will have the final
>say when it all comes down! Besides, isnt "nuts2u::little" a wee bit obnoxious?

Well thanks for the compliment(?) and suggestion. The "nuts2u::little" is apparently a result of the software I'm using to post to the net. I have such a distaste for the various news readers that I use a program that organizes news postings into a VAX NOTES notes file and lets me use a more civilized interface (just wish it had a kill file). It apparently drops my normal personal name and inserts my DECnet mail address. And as the node name of this cluster was selected long before I got on it... (all the nodes in the cluster are names of nuts)

And as usual, this topic has been dragged down another irrelevant rat hole. So much for rational logical debate. A "survey"? PUH-LEEZE I think is appropriate, although I'd "hate" to be called effeminate. It would so wound me.

Last I heard, the FCC manages the spectrum and licensing for all the citizens of the US, not just the amateurs. If you want a survey, ask the public, not the membership of some exclusive clique. Ask the members of any organization that has initiation rights if they want to change those rights and you will get what you expect. Behavioralist tell us that our actions are 95% habit and as such, most people will respond out of habit, i.e. I had to do it so you have to do it. Also remember folks, we represent less than 1/4 of 1% of the US population. If the other 99.75% of the population thinks our spectrum could be better utilized through other licensing means, it's going to happen.

OH yeah, one other thing. This red-herring about whining is pretty funny. The most vociferous pro-change postings in this thread have been by amateurs who have demonstrated knowledge of Morse code (including myself). Or does anyone that advocates change automatically become a whiner? Personally, I'd rather be a conehead, but maybe it's because of my first name that I'm being called a Whiner. ;-)

Change is a difficult and dearly fought process, but change is inevitable. It's obvious from this thread that increasing the courtesy and respect within our ranks is a lost cause. I just hope we can institute changes that increase the technical and operating knowledge of amateurs while at the same time increase our ranks. We are an endangered species. Let's not become dinosaurs.

73,
Todd Who hopes he never has to visit Rhode Island and glad
N9MWB he lives in Chicago. We're one big happy family out here.

: I am afraid that I must disagree with Alan here - IF the plane were capable
: of exactly tracking the antenna,

Except that the above description is not problem I was addressing.
It doesn't matter if the antenna is rotating or the plane is revolving,
you get modulation in either case. Obviously if both are turning in
the same direction at the same rate there is no modulation.

All these scenarios can be analyzed quite easily by just remembering the
simple rule: If the amplitude, frequency or phase rate changes as a
function of time, then there must be sidebands. It doesn't matter how the
modulation is generated.

For extra credit, try this problem:

Consider a 1 MHz RF carrier 50% modulated with a 1000 Hz sine wave.
I think we all agree it will have sidebands +/- 1 kHz from the carier.
In the receiver, include a circuit that AM modulates the signal with
a 1000 cycle tone 180 degrees out of phase:

AM signal = sin(2*PI*1000000) * [sin(2*PI*1000)/2 + 1]
50% modulation-----^

Modulated (multiplied) by:

1 / [sin(2*PI*1000)/2 + 1]

So the resulting signal is just:

sin(2*PI*1000000) an unmodulated signal.

Does this unmodulated signal have sidebands? If not where
did they go?

I am preparing to retire about 1000' of 9913 due to moisture intrusion over the last 5 years. Very disappointed. RG213 has very little extra loss; by the time the 9913 starts dying, the 213 comes out ahead.

>voltage is rasied 2X by the plate modulator. All other forms of grid and
>choke modulation (low level) *for the same carrier input to the same circuit
>topology* produce some lesser value of peak envelope power.

Hmmmm. First of all, as all the died-in-their-woollies AMer's will tell
you, 4 * carrier_power = peak_power is true for *all* DSB-plus-full-carrier
modulation. And that relates to output power, not input power. Remember
the cries of anguish heard across the land when the FCC made the maximum
power limit for amateurs 1500 watts *peak envelope power*. That means
a carrier power output of 375 watts.

Plate modulation has the advantage of high efficiency. Period.

Control-grid modulation, screen-grid modulation, suppressor-grid modulation
and cathode modulation are *all* high-level modulation methods when
applied to the final amplifier. As is plate-modulation when so applied.
The key consideration is that the modulated stage has no linearity
requirements imposed upon it.

Low-level modulation is applying the modulation process to an amplifying
stage before the final and then *linearly* amplifying the signal up to
the desired power level.

> Taylor and
>Doherty modulation (not the same circuit topology) are capable of producing
>higher values of p.e.p. during the positive half of the modulation cycle as
>well and would be considered high level modulation.

I'll believe Taylor (isn't that the screen-grid modulation scheme used
by Continental Electronics). The Doherty was a pure linear amplifier
optimized for AM. It was never modulated itself. And, yes, it was capable
of positive modulation peaks in excess of 100%, but that would have been
with an unsymmetrical (or distorted) waveform.

2020. PVC tubing for mast?

Newsgroup: rec.radio.amateur.misc
Date: 1993-05-05 19:34:13 UTC
From: markm@bigfoot.sps.mot.com
Message-ID: <1993May5.193413.25897@newsgate.sps.mot.com>
Source record: 282130

Does anyone have any experience using PVC tubing for antenna support masts? I'm thinking of putting up an inverted-vee and would like to get the apex up 40 feet or higher. I have heard of people using PVC tubing to construct masts but have never heard any details about it. Is schedule 40 rigid enough? What diameter would be required? How well does it hold up?

I've also seen plans in the Handbooks for wood masts constructed from 2x4's or 2x3's. Anyone ever built one of these? I would think that 20+ ft timbers would be expensive and heavy. If it would work, it seems that PVC would be light, cheap and easy to work with. They also might be useful for Field Day.

Any comments or suggestions?

Thanks & 73... Mark AA7TA

I would guess that the 26th letter of the alphabet is pronounced "zed" in
many more places and by more people than pronounce it "zee". It is "zed"
all over Europe, Canada, and (I think) South America, Australia, India, and
African countries where "z" is part of the alphabet.

I've often wondered why Americans pronounced it "zee"? Is there a history to
that that might be worth knowing?

Source record: 282126

As an alternative to 9913 you might consider Aircom Plus. This
is a new product being imported to USA from Germany by SSB
Electronics.

Like 9913 the dielectric is partly air. But instead of the spiral
separator used in 9913 it has five radial ribs extending from a
thin tube around the center conductor to another outer tube. They
call it a plastic expander. It has solid copper foil shield (appears
to be heavier than 9913) and a braid. Solid inner conductor.
They say you can bend the coax sharply without displacing the center
conductor. The expander "provides a tight seal around the inner
conductor, ensuring it is protected against moisture and corosion".

A special N plug has been made for the cable. It has a 3 micron gold plated
interior pin, nickel plated exterior, waterproof construction and
]operates to 10 GHz. I was told it is longer too which provides a
better grip of the outer conductor.

Price is supposed to be around 80 cents but they really were just
guessing until the first shipment arrives and they find out the
shipping costs and duties.

Call Jerry K3MKZ
717-868-5643 (eve).

I have no ax to grind - just listened to the pitch at Dayton and
brought home a sample.

2024. TDMA radios

Newsgroup: rec.radio.amateur.misc
Date: 1993-05-05 21:10:34 UTC
From: cep4478@ultb.isc.rit.edu
Message-ID: <1993May5.211034.14294@ultb.isc.rit.edu>
Source record: 282134

Can anybody point me to any elementary articles on how to implement a TDMA point-to-multipoint wide-bandwidth data radio? The basic ideas seem simple enough, but I can't quite see how you'd build a practical system. Specifically, when I think of timesharing a channel, I think in terms of control packets and go-ahead messages, but if you've got a timeline sliced up into tiny little chunks, the speed-of-light at, say, 1/4-T1 speeds, becomes a significant number of bits for a 20-30 mile path. I don't see how you can get away with losing that much time out of the timeslice, without having a lot of dead airtime in between when a close-in radio trasmits and a far-away radio gets its timeslice.

Chris

Well, now, I said "Who cares" earlier. I stand by that. We've hashed it all out before. But ...

I agree with Tony and Tiffany. I'm all for the Codeless license as it stands now. I was against it before, but it has had no ill effects I've seen. Should we expand the privileges of codeless techs? Nope, I don't think we should. HF being what it is, sometimes cw works best. No denying it; it happens to be true. Whether you use it or not, it's up to you. But, if you're going to operate those frequencies, you should know it at least. If you don't want to operate those frequencies, don't upgrade. If you do want to operate those frequencies, upgrade. That's all from here. Keep things the way they are. They work that way. Those who want to upgrade and use hf will. Those who don't ... well, won't.

As an additional note, I got my Novice (with code) at 14; got my general four months later. I sat on my butt and didn't study and waited oh--about two years (or was it three?) to upgrade to Advanced. Took a little over a year (just enough to let my CSCE lapse) to pass my extra, the easiest one.

CSCE? Yup. It wasn't for theory either. I passed the 20 wpm _three_ times. First, in January '88 at 14; again in '90 (or '91) January; and again in February 28 1992 when I finally passed the theory. (Not that the theory is hard; the Advanced is hardest, but that's not too too bad ...) The code isn't so bad .. I'd say if half the energy spent in pis-and-moan sessions about how hard the code is was expended to actually learn it and improve it, probably everyone would pass 20 if they wanted to. Oh well ... No more on this from me. I've said my share, and I've done too much of that even, considering that I think this whole thread is silly.

one problem that i have seen all over the country is that, in general, any reference material you might come across about amateur radio is from the 1950s. (this also seems to be generally true for electronics overall). I have been dropping off old handbooks and other publications as i can afford it, but that runs the risk of a librarian doing a quick compare of subject matter and having them incorrectly decide that they already have a book on the subject on the shelf and put the new, shiny, saleable book in the pile for the upcoming library book sale fund drive.

and don't forget about the public school libraries -- in many cases they are in worse shape. (it was interesting reading a 1947 book on electronics, but it's hardly representative of the last 20 years of developments....)

getting reasonably current information about amateur radio into the library systems of the US should be a goal. there should not be a library without a handbook under 10 years old. (not to keen about license manuals going in since they age and become unusuable faster than a general reference work).

>For casual use, this is probably close enough.

Probably, but the formula is F=1/(2*pi*sqrt(LC) so scaling by the
sqrt of the frequency ratio gives a better approximation. In this
case, moving from 40 to 30 meters requires a 0.86 scale factor.

>However, stuff like input and output impedances often vary
>with frequency unless feedback is used to control them. Thus,
>the networks may have to changed to accommodate the new impedances.

If you move both reactances equally, the impedance of the network
should remain the same at the new frequency as the unscaled network's
impedance at the old frequency. If you only scale one of the reactances,
the network impedance will change with the frequency shift.

2033. Confusing letters in call signs

Newsgroup: rec.radio.amateur.misc
Date: 1993-05-05 22:22:14 UTC
From: a-kevinp@microsoft.COM
Message-ID: <9305052222.AA15145@netmail.microsoft.com>
Source record: 282137

M and N

Was that WIM or WIN.

I only identify as phonetics even on 2m FM (N 7 Whiskey India Mike). I have a British accent and for some reason I can't get this one clear enough for the local americans.

My UK call is almost never confused: U D P. All these letters are short (possibility of a pop on the P). And is more difficult to say with phonetics: Uniform Delta Papa

So:

1. Choose no confusing letters
2. With good phonetics

ABCDEFGHIJKLMNOPQRSTUVWXYZ

remove confusing letters:

ACDEHIKLOPQRTUXY

remove long phonetics

ACDEHIKLOPTXY

Now you may want to use this call on CW. Remove the long or easily confused letters.

ADEIKLT

Then pick a call with good rythmn from these letters (for example WIM has a good rythmn but EIE has por rythmn.

Well it all seems logical!

>Thanks & 73... Mark AA7TA

A friend once built a 66' PVC mast. He started with really large diameter (4" as I recall) and tapered it down with height. He said it was really a bear to get up. Although a 12' piece of the stuff seems pretty rigid, in long lengths it just resembles cooked spaghetti. The mast was guyed in several places and stayed up fine until the polypropylene rope rotted due to UV exposure (about 6 months)(Whoops). He was running a wire down it for a vertical, and wasn't trying to support any wires with it. Based on that experience, he felt that 30 or maybe 40 feet was a realistic limit for a guyed PVC mast.

I've used PVC as spreaders for a ZL-special like array for several years. It seems to hold up well in sunlight, but any deterioration would be much faster at most other locations. (We don't see the sun much here in the land of moss and slugs.)

For the past 15 years or so I've had two wooden A-frames in the back yard. One is 43' high, made from 2X4's, and the other is 39', made from 2X3's. They're guyed with two ropes at the center and three at the top. Both have withstood strong winds without problems. They were very easy to build and are good and strong. It may be difficult to get decent 20-24' lumber these days - check with a lumber yard. Seems to me the plans for the A-frame were in the ARRL Handbook, but it may have been only the Antenna Book. They were there for decades. I see the same drawing in my 15th edition ARRL Antenna Book on p. 22-4. If you decide to build one, I'll be glad to pass along a couple of things I've learned from using a couple of them for 15 years.

Good luck!

> Shouldn't the rolls of "male" and "female" be switched here? I would think
> you would want the female connector to be attached to the power source.
> [Or have I misread the above]

A MOLEX female shell has lots of room around the contacts, while a male
shell the contacts are nearly completely covered by the shell. It's the
shape of the plastic shell that he's revering to when saying male or female
bodies. Take a look at one, it's obvious which way you want it to be.

I have a 40 meter inverted vee on my roof using 1 1/2 inch sched 40.
I built a steel wool balun into the top of it. Although its only
about 11 feet tall, it works well and could be reasonable extended
to 20 feet. I painted it to protect from UV. (Mark) Give me a call
if you want to see it.

As someone else has pointed out what about selling a non-scanning
receiver -- just receives the WX frequencies, unless you open it up
snip a wire and then it becomes a scanner, including the cellular bands?

Seems like this isn't covered (as the regulations don't apply to a
non-scanning RX -- even if it is easily modified to become a scanner).

Does a repeater make a kerchunk when no-one is listening to it? :-)

myers@hpfcso.FC.HP.COM (Bob Myers) writes:
>Is there some reason that bulletins, orbital elements, etc., are still being
>posted both here and in rec.radio.info?

Yes. rec.radio.info serves as a cross-posting point for informational articles across all radio topics (not just amateur radio.) They're also posted here in rec.radio.amateur.misc because those articles do apply to amateur radio.

That doesn't always seem intuitive but the big difference is that we're dealing with 2 different kinds of newsgroups. r.r.a.misc is for discussion and all the traditional unmoderated newsgroup stuff. rec.radio.info is for informational articles so that automated archives and new users looking for a quick info resource have a single place to go. rec.radio.info is patterned after news.answers, which works the same way, just on a significantly higher volume.

The only articles that I noticed which are only posted to rec.radio.info (besides the intro/welcome messages from the moderator) are the daily solar bulletins. I think they were driven away from r.r.a.misc by people who flamed them.

In general, if it applies to amateur radio, it will/should be posted in r.r.a.misc. If it's an informational posting about any kind of radio, it should be cross-posted to rec.radio.info.

>I thought that that group was created
>specifically to relieve the clogging of the .misc groups; it certainly hasn't
>done that, and now I simply see duplication.

That wasn't exactly the purpose. But Paul KD3FU already covered that topic.

This situation may change a little if the reorganization passes its upcoming vote. For example, the space-related bulletins would very likely migrate to rec.radio.amateur.space. The DX-related ones to rec.radio.amateur.dx... etc. So that will reduce the load on rec.radio.amateur.misc right there.

But that is all pending the outcome of the vote. The Call for Votes (CFV) for the reorganization is just about ready to be sent to the moderator of news.announce.newgroups. Depending on how many articles he gets at once, it may take 3-5 days or more to get posted. (It will be cross-posted here.) But it's coming soon.

2046. Florida Ham's Legal Battle Over Antenna

Newsgroup: rec.radio.amateur.misc
Date: 1993-05-06 01:29:07 UTC
From: jgervais@weber.ucsd.edu
Message-ID: <1s9pl3$e84@network.ucsd.edu>
Source record: 282152

A few months ago there was a ham in Florida who apparently
was having serious legal troubles regarding (I believe) their
antenna. Has anyone heard anything of his/her current plight?

As a "clandestine" condo ham (with dreams of owning a large
hilltop) I'd be very disappointed if the laws of the land
started turning against hams/antennas right at the moment
when I'm getting close to owning that darn hill....

Not to mention my concern for a fellow ham too, of course. :-)

2047. Need Help Debugging Rig

Newsgroup: rec.radio.amateur.misc
Date: 1993-05-06 01:38:28 UTC
From: paulb@harley.tti.com
Message-ID: <1993May6.013828.20116@ttinews.tti.com>
Source record: 282156

The Story:
I built a 30M A&A QRP rig. (The Gary Breed Xcvr).
I built a 30M inverted-vee dipole with 1:1 balun to go with it.
An SWR Analyzer showed a 1.25:1 SWR. So did my SWR meter.
They worked fine for a while.
One day, I was in the middle of a QSO when my wife came running in.
She was watching a tape and my QSO at the same time. VCRI
at 9 watts!
I noticed that my SWR meter was showing 3:1. SOmething was wrong.

I found an intermittent braid connection on my PL259 coonector at
the back of the power meter. I replaced the connector. Still 3:1.
Then I checked the antenna with the SWR analyzer (using all the
same coax & connectors). That showed 1.25:1 as it always did.

At that point, I felt that my antenna/balun were still good and
that the braid must've unhooked and overloaded the rear end of
the xmtr. When I put the set into a dummy load, i shows a 1:1 SWR.
So, I suspect that my rig is puttinbg out spurious signals
and those out of band are being reflected back.
I replaced the power xistor and toroids on the low
pass filter. I retuned the set. STill 3:1.

Any suggestions would be greatly appreciated. I do not have a
spectrum analyzer.

Meeting, n.: An assembly of people coming together to decide what person or
department not represented in the room must solve a problem.

>case, moving from 40 to 30 meters requires a 0.86 scale factor.

So, to double F you need to halve sqrt(LC), according to the
formula.

Or, squaring both sides, F^2 is proportional to 1/LC

Note that if you make 1/L proportional to F and 1/C proportional
to F you get an *exact* scaling. Pretty convenient, IMO.

It seems that Gary has botched the math. Fortunately, I have
lots of patience. :-).
>

>the network impedance will change with the frequency shift.

Sorry about that, I was writing about the impedances of the devices
being matched by the network, and not the network itself. This is
the great thing about MMIC or monolithic microwave integrated circuits
with 50 ohm input and output impedances. Your typical active mixer chip
isn't as well behaved.

I must say that associating terms like "feedback" or "control"
to passive LC circuits is a bit unusual. You working on something
really exotic?

Nope, started out as a no-code but then realized there was more to ham radio than 6m and up! This happened within a month of getting my no-code ticket. A year later I'm an Extra, at least I didn't whine about the code requirement. Hey, just put forth the effort and it shall be yours. But don't try to change it so that all you have to do is send a form and $5.00 to the FCC to get on the amateur bands.

And just out of curiosity, why do I get the feeling you're a perpetual no-code?

And why is it that most of the most violent anti-code people we hear from are from 6 land?

2050. Rover Antennas

Newsgroup: rec.radio.amateur.misc
Date: 1993-05-06 03:02:37 UTC
From: zlau@arrl.org
Message-ID: <1448@arrl.org>
Source record: 282038

I know we have a month to go before the June VHF
contest, but perhaps people might benefit from these
questions?

What are the best paints to use on microwave antennas?
I'd like to put something like "Amateur Radio" on my
dish antennas so people don't have to ask :-).

Our books suggest a stacking distance for antennas of
different bands of half the boom length or a multiple
of a half wavelength of the smaller array. However, I'm
thinking of a better approach. Suppose we calculate the
apertures of the individual antennas and keep objects
likely to interfere with out of the aperture. Thus,
you would keep an FO-22 22 el 432 yagi at least 2.6 feet
away from the other antennas. By comparison, half a
a wavelength would be 1.1 feet, which is too little
in my experience. Half the boom length seems a bit
excessive (7 ft.), but does computer modeling show
otherwise?

Finally, why can't a sports car be used for mountain topping?
I thought they are suppose to excel on twisty mountain roads.
I don't know about you, I'd rather be moving with traffic than
going at 45 mph in an underpowered van, particularly if the
great spot is 300 miles away.

Granted, they aren't designed for off road use, but I've not
heard of a serious VHF group that uses a site that doesn't have
some sort of usable access road. And for a rover station, it
might not pay to spend the extra time getting to really great
spots. Equipment performance has gotten to the point where line
of sight often isn't necessary. The CT mountain park access roads
were still closed for the winter, so I went to the beach park (its
open because they charge for parking). So, 30 ft. above sea level
I work a new grid--FM19, about 265 miles away on 1296 MHz with 10
watts.

I don't see space being a problem--I'm pretty sure you can fit
my 432 MHz to 10 GHz station into a Toyota Supra, though squeezing
big 2 and 6 meter antennas might be a problem. But, rover stations
are probably better off with manageable antennas.

Hope to "share" Equinox with the auto race and W1TKZ in June.

Also S/X

as in de WB5KXH

I think that problem is also because in English, you don't see
many words with X, lots with S - so people tend to "hear"
S instead...

Yea, lets. Somebody better turn him on his back. He could drown if there's a heavy rain, lying face down in the gutter like that.

As for a poll, the only one that counted was the one that the FCC held. It was called sending in your comments on NPRM 90-55. I did. And the result was a lot more than I expected.

The Amateur Service exists for the benefit of all the citizens of the United States. (Which reminds me, how many of you computer geniuses put a "Distribution: usa" header in your posting so that the rest of the world, which has had no-code licenses for 20 years, didn't have to bother with this.)

Well, just had to post this,

I've done this on the 440 band and it works nicely. Why 440?? Well
I had the RF stuff for free. Why did I do it?? Well, 'cuz I wanted to
see the advantages of SS and because I had a class in it.

I'm working on PHD in EE in Com and Emag. Going to finish up in a bit and
work out to Wright Pat. Out to Wright-Pat, they like SS cuz of jammers and
to keep the 'enemy' from finding you out - Prob of intercept.

Also :

I WAS A NO-CODE!!! I am now an advanced - failed the 20wpm just
a couple of weekends ago. Main prob is time for the practice and to
got to the gym and to eat and to sleep..... Standard .edu stuff

I got the no-code because I was a techno-geek and liked the aspect
of packet radio. I know that I would not be in the ranks of ham radio
without the no-code scheme. Problem is, that the tests are WAY TOO
EASY and the with the no-code, there really is no feeling of accomplishment.
consequently, alot of folks just stay no-code and never "grow"

I will pass the 20wpm here in June. The wife seems to be a bit better
right now - but that is a temp condition. We should both be Extra by
mid June (she is a EE also) The code really makes up appreciate the
privs that are part of being a ham.....

And then again, perhaps I am just tired and waiting for a program to
finish running on the Stellar and don't know what I'm saying.... :)

To all radio amateurs

SB QST ARL ARLB050
ARLB050 Scanner ban timetable

Changes in FCC rules regarding radio scanners capable of receiving
cellular telephone transmissions will be implemented over the next
year.

Effective with the adoption of the new FCC Part 15 rules on April
26, 1993, the Commission will not grant equipment authorization for
receivers that do not comply with the new provisions of Part 15.121.
These new provisions do not prohibit the sale or use of authorized
receivers manufactured in the U.S., or imported into the U.S., prior
to April 26, 1994.

In addition, the manufacture or importation of scanning receivers,
and frequency converters designed or marketed for use with scanning
receivers, that do not comply with the new provisions in Part
15.121, must cease by April 26, 1994.

More informaton this will appear in June QST.

2058. Brand new Ham Radio CDROM

Newsgroup: rec.radio.amateur.misc
Date: 1993-05-06 06:13:00 UTC
From: rab@sprite.berkeley.edu
Message-ID: <1saa9c$hpk@agate.berkeley.edu>
Source record: 282166

Hi,
We just finished the "QRZ! Ham Radio CDROM". This disc contains the most recent U.S. Callsign Database, hundreds of shareware programs, Radio MODS, packet radio stuff, Usenet ham radio archives, FCC rules and regulations, exam question pools, Morse code tutorial, Canadian Callsigns, and much more.

Fred Lloyd (email: Fred.Lloyd@west.sun.com, callsign: AA7BQ) is the editor for this this disc. I think he did a really good job putting it all together.

If you want more details about this disc, you can ftp the readme and index from cdrom.com:/pub/cdroms/ham.

The price is $25. S&H is $5 for US/Canada/Mexico, and $10 for overseas. If you live in California, please add sales tax. You can pay by check, money order, Visa/MC/Amex, gold bullion, small unmarked bills, etc.

Bob Bruce
Walnut Creek CDROM
1547 Palos Verdes Mall, Suite 260
Walnut Creek, CA 94596

1 800 786-9907
1 510 674-0821 FAX
orders@cdrom.com

Many of the programs on this disc are shareware, and require seperate payment to the author for continued use. If you are dissatisfied with the disc for any reason you can return it for a full refund.

Here is a list of some other CD-ROM titles published by Walnut Creek CDROM:

CICA Microsoft Windows CD-ROM - Shareware collection from Ind Univ $25
Simtel20 MSDOS CD-ROM - shareware/PD swr collection $25
GIFs Galore - Thousands of GIF images $25
Hobbes OS/2 CD-ROM - shareware & PD swr collection for OS/2 $25
Garbo MSDOS/MAC CD-ROM - shareware & PD for DOS and Mac $25
Sprite CDROM - Sprite Research Operating System $25
Nova CDROM - NeXT Workstation software $40
Source Code CD-ROM - Usenet source archives on CD-ROM $40
X11R5 and GNU CD-ROM - X11R5 Window System Source $40
C User's Group Library CDROM - C source code $50
Libris Britannia - British shareware $69

For a more detailed list, you can ftp the latest catalog from cdrom.com:/pub/catalog, or send email to info@cdrom.com.

-bob

: plug with female pins goes to the power source. The female
: plug with male pins goes to the rig.]

: [N5RCK notes on the connector: the above description may not
: make it clear - the "male" plug has the smaller outside
: dimensions and hence is designed to plug "into" the "female"
: connector. The male plug has enclosed female pins (hence is
: very hard to touch or short the pins) and is to be connected
: to the power supply side (source). The female plug has open
: male pins (hence accessible) and is to be connected to the
: equipment side (sink). The plugs have a flat (squared off)
.. stuff deleted

OK, folks, here's the scoop. Yes, it boils down to semantics, but
take it from a former chassis wireman:

<Warning - the following discussion contains sexually explicit
material, sensitive viewers may want to find something else to
watch...>

A connector's gender is identified by the contact that it houses.

A male connector body, or housing, contains pins. Generally those
pins will stick out, although they do not necessarily extend beyond
the shell. An exception is the cord caps used for 120 V.A.C. power,
but these are low cost, and generally sturdier (except for the ground
pin, which is seems to be weaker, since it is always broken off).

A female connector body contains sockets, into which the male pins are inserted. These are usually recessed into the connector housing. Since they are better protected (except from two-year-olds with paper clips), a good design will use them for the power source.

It doesn't matter how the housings mate with each other.

Now, lets do a table:

Male Female
Plug Receptacle
Pin Socket
Plug Jack
Pen(well, you get the picture). Just ask your self - does it have a pin sticking out, or a hole to stick it in.

So, to summarize, Male plugs have pins, female receptacles have sockets.

All puns are intended, all offense is not.
Peace, JA

>haven't looked at the slope of the FLEXI curve to see if it matches that of
>9913. 50 MHz seemed a good common data point for my applicaion.) I conclude

Can you be more specific about your application. As several have
mentioned, the loss of almost any quality coax in the HF range is very
low (although 50 MHz is usually considered a VHF frequency). I'm
guessing that since you are considering paying dearly for this cable
that you must be planning a long run, or simply trying to eek out the
absolute most power.

If your application doesn't need the flexibility, have you considered
hardline? 75 ohm 3/4" hardline can typically be had for free from
cable TV companies and it has approximately half the loss, i.e. 0.45 dB
vs 0.9 dB for a 100' run.

Or go with open wire if the application is conducive to that.

Along the same lines, has anyone had experiece using 9913 right at the
antenna, i.e. not using a more flexible cable from the antenna to the
tower? Several folks in this area have suggested that its flexible
enough to do that, but I'm a bit skeptical.

73,
Todd

Well actually I think it's not flourecent but actually neon lights they use. As I recall neon lights typically require high voltage transformers to supply them with several thousand volts to operate. I suspect this is the soucre of the 'hash' you were receiving.

Yup! Hey, maybe we should get Andy Rooney on 60 Minutes to do one of his "Did you ever wonder why?" segments about the no-code issue and how the ARRL stabbed every amateur in the back.

This from someone who's seriously considering dropping his ARRL membership come renewal time. But then again, from what I've been hearing, the only reason most people are ARRL members is because QST is part of the deal. Heh.... yeah, mostly ads too.

>close-in radio transmits and a far-away radio gets its timeslice.
>
InterDigital Corp makes and sells a product called the Ultraphone that uses TDMA to communicate between a base station and up to four subscriber units on a single RF channel pair (separate receive and transmit frequencies).

The Ultraphone uses a 45msec frame. The timeslice for each subscriber is 11.25 msec. With the modulation that is used each subscriber unit has an effective data rate of just under 16kbps. The "just under" is to allow for guard time between each timeslice. The Ultraphone avoids the need for a large guard time by using dynamic time adjustment in the subscriber units. The base station continually monitors the timing of the data packets that it receives. If the base station detects that a subscriber's data is arriving too early (a close-in subscriber) it will direct that unit to delay its transmit timing. If a subscriber unit is transmitting too late (a far away unit) the base station will direct that unit to advance its transmit timing. The advance and delay are relative to the timing of the timeslice that the subscriber unit receives. A few bits in the base station to subscriber path are reserved for the timing adjustment information. At the start of each call less data is sent, allowing more guard time. The base station can usually properly adjust the subscribers transmit timing within three 45 msec frames.

I believe that a similar method is being used in the new TDMA digital cellular systems that are now being developed. I think InterDigital has a patent on the general scheme.

At my knowledge, the Doherty modulation is often used on high power
AM transmitters. I think it is used on Continental Electronics'
Megawatt AM transmitter.

2069. Small HF transeiver recommendations ??

Newsgroup: rec.radio.amateur.misc
Date: 1993-05-06 11:02:55 UTC
From: rjc@crosfield.co.uk
Message-ID: <1993May6.110255.6397@crosfield.co.uk>
Source record: 282177

Hi,
I've been dormant on HF for some time (because I'm living in an appartment),
but shortly I hope to move to a house where I should be more able to use HF.

My current HF gear is very old, all valve and I would like to buy something more
modern or even new.

Can anyone out there in net land give me any recommendations or comments on
rigs to avoid !!

My basic requirements are that the rig should cover all HF bands TX with general
coverage RX. It should be small enough to put in a car, and hence should run
on 12V electrics without any external inverters etc.

Thanks in advance.

Roger Clark. G4KYF.

Yah, I home-brewed a 2m beam antenna (Log-Yagi), and fed it all the way with 9913-equivalent coax for test purposes... I wouldn't (and didn't) leave it that way, cuz the flexing from the rotator will break the center conductor eventually. I've been using BNC connectors made for RG213 on it, and gooping them with RTV, then wrapping with electrical tape. No leaks so far, about 2 months. -Tom R. N1OOQ

> for more than a few years.
NOT! I have been licensed long enough to remember having to draw schematics on the test! I support a no-code entry license. It has brought some fine people into the hobby and has provided many of them with enough exposure that they want (60% of them actually DO it!) to upgrade and expand their "Ham Radio Horizons". Wihout this recent increase in hams, all buying new equipment and asking questions and trying to learn (from the closed minds like we hear on this 'Net?) we are growing again. We have a reason to expect a continued flow of new equipment and new issues to be resolved on the air. There have been disputes over EVERY change I have witnessed in my 37 years with a ticket. Every change was met with Nay-sayers who predicted the dire consequences of gloom and doom. Yes, the incentive mess of '68 DID nearly wreck Amateur Radio in this country...but we survived. Now we have a great influx, for the first time in 25 years, so step aside and help elmer these new comers. They will keep the hobby strong, and they *want* to learn...if you could turn off the flame-throwers long enough to teach them... And, you might even *learn* something from them (I do, in every class I teach) *if* you can shut your mouths long enough to let your ears take over... The "no-clues" I hear running DX hand-holding nets and speech processors splattering up the bands all have callsigns from 1r years or so ago...not the new-comers!

> The no-clues (oops I mean no-codes) have increased disproportionately
> to other licenses. It figures though.
Yes, it does, but NOT for the reasons you cite. What it shows is that there were a huge group of people with enough willingness to study -- even rote memorization of the pool takes some mental energy -- to gain entry, and that 60% go on to upgrade shows they came to stay and they came to play. Lighten up and help out.... or shut up and get out of the way... Sheesh!

> Two meters sounds something reminiscient of CB around here.
Finally it spread to RI, huh? Been like that in major metro areas for years. If *you* had really been around as long as you'd like people to think, you'd already know how vaccuous and leaky your arguement is.

> It is not necessarily the code requirement that bothers me. It is the
> joke of a test which is administered.

This point, I'll give you. The written test *is* easy. Someone suggested not long ago that people wanting tickets be brought into a room with soldering stations and basic metering available..with a parts bin, and when they managed a QSO, under VE supervision of course, they could get a ticket...Then, to get an extra, you have to do ATV or something hard...CW would get you a novice with full HF CW privileges; FM would get a technician, with full VHF/UHF; SSB would gain a general, but would ONLY allow HF SSB; SSB/CW/AM/FM would qualify for an advanced and give those modes in HF/VHF/UHF...and for the extra, building the ATV would permit any and all modes (no more of the part 97 restrictions on mode so we could *really* experiment) on all bands, consistent with frequency allocations and Internatyional Agreements... *THEN* we'd see how many of those fancy new call signs would be left when the dust settled! ;^)

Geez, guys. This is progress. It ain't perfect, but it *is* what we have, and we need to make the best of it, rather than grousing about it... Get a Life! ;^)

>Modulated (multiplied) by:
>
> 1 / [sin(2*PI*1000)/2 + 1]

Now that's a bit naughty - not only have you turned a multiply into a
divide but you left the 'pi' out! Could you be trying to fool us?

>So the resulting signal is just:
>
> sin(2*PI*1000000) an unmodulated signal.
>
>Does this unmodulated signal have sidebands? If not where
>did they go?

Ah, but if we were to write out the maths properly (!), we would find that
the following would happen.

Tx signal:

sin(2*pi*1000000) * [1 + (sin(2*pi*1000))/2]

I think (but am not sure :-)) that you intend to multiply this at the rx by:

[1 + (sin(2*pi*1000 + pi))/2]

But, sin(x + pi) = - sin(x).

At the output of the receiver multiplier, therefore, we are left with:

sin(2*pi*1000000) * [1+(sin(2*pi*1000))/2] * [1-(sin(2*pi*1000))/2]

If we multiplied all this out we'd find that we get two sets of sidebands at
+/- 1 KHz, of equal magnitude but in antiphase, so cancellation occurs.
What we actually get, though, isn't simply the carrier:

for simplicity use the relation (a+b)(a-b)=a^2 - b^2

therefore, output is

sin(2*pi*1000000) * [1-sin^2(2*pi*1000)/4]

=sin(2*pi*1000000)* [1-[(1-cos(4*pi*1000))/8), using 2sin^2(a)= 1-cos2a.

=sin(2*pi*1000000) * [7/8 + cos(4*pi*1000)/8]

which gives us sidebands at twice the modulation frequency, or +/- 2KHz.

>AL N1AL

Now, what was the question again?

Simon G0GWA.

2081. correction to Macintosh Amateur Radio Software - May 1993

Just after I released this list, I received a note that the new Novice and Technician Hypercard Test Stacks by Diana-KC1SP have been out at an ftp'able site. The below information should be used to replace the original text sent out earlier this week.

======== cut here ============
Ham Test Stacks
HyperCard stacks containing the entire question pool for each license class. Can be used for preparation or generating actual tests.
The current releases are: Novice v4.1(new questions eff. 7/1/93), Technician v4.0(new questions eff. 7/1/93), General v2.4, Advanced v2.4, Extra v2.4
If you wish to receive these PUBLIC DOMAIN stacks, please send a SASE (self addressed STAMPED envelope - 2 ounces postage = .52) and 800K diskette to the author: Diana L. Syriac, 3 Spruce Street, Hudson, NH 03051. I will no longer send out the stacks unless the envelope has sufficient postage for return mail (in general, that means .52-.98, depending on size of envelope) and for those who send a standard business envelope, I take no responsibility for the condition of the diskette through USnail.
Available via anonymous FTP from various sites, including uxc.cso.uiuc.edu (/pub/ham-radio). NOTE: The newest releases of Novice and Technician stacks are available at uxc.cso.uiuc.edu (5/6/93) Author is available via Internet: dls@genrad.com
======== cut here ============

Great!

Tell me (and the net) more. Is it bigger than a bread box? What radio equipment did you use as the starting point? How did you solve the synch problems between units?

Spread Spectrum just looks like the kind of technology we could use as a fall back position when the FCC wants to take a band away. Perhaps we could have talked the FCC into letting hams keep that (now missing) 2Mhz portion of the 220 band as a SS only secondary allocation instead of losing it altogether.

In article <930503.231753.9O3.rusnews.w165w@mooch.sbs.com>
system@mooch.sbs.com (Christopher Ogren) writes:

>I would like to see a
>poll, pertaining to no-code approval, of amateurs who were licensed
>BEFORE the no-code's inception. You might be surprised that it is not a
>majority of those hams who favored the no-code license.

it seems to me that there are two issues being discussed (and flamed about)
here, not one.

first, there is the question of whether or not people feel that the no-code
license should have been created. I never really had an opinion either way
(good or bad) on this issue, and frankly, still don't. I know a lot of
people who were opposed to it, and a lot who weren't. of course, none of
this really matters anymore, as the license class exists, and we can sit
here and argue back and forth until our fingers drop off, but it's all a
waste of time and bandwidth.

the second issue is how people treat these new amateur radio ops who came
in under the no-code license, now that it exists. all of the folks I know
who were opposed to the creation of this license welcome the new hams, and
are happy to offer their help (not insults...real help) to bring the new
folks up to speed, just as has always been done in amateur radio (i.e.,
they don't let their dislike for the license itself influence the way that
they treat the people who hold that licens). of course, it would seem that
there are some folks here who insist on venting their distaste for the new
license on the new hams.

now, whether the majority of hams were in favor of or opposed to the
no-code license is, to me, unimportant, as it is a done deal. the license
exists. a vote, even if overwhelmingly against, isn't going to do much.
the important thing is whether or not the majority of hams treats the new
hams (those who got in under the no-code license) like amateur radio
operators. I believe, from what I've seen, that a strong majority of hams
treat these folks just like any other new ham, which is as it should be.

just my $ 0.10 worth....

2088. Need ATV receiver advice

Newsgroup: rec.radio.amateur.misc
Date: 1993-05-06 16:25:45 UTC
From: andrem@pyrtech.mis.pyramid.com
Message-ID: <1sbe69$bre@pyrtech.mis.pyramid.com>
Source record: 282048

As posted here a while ago, I'm working on getting an ATV setup working to get live video from cars on a racetrack. I've gotten a hold of a transmitter setup (made by PC Electronics, I think), which seems to work ok (well, it looks like we'll have to replace the final, but what the hell...) The transmitter is currently set for 434 Mhz.

Now that I've got that piece, I need to get a receiver to use with it. A member of the car club has monitors that he can make available, so I need a receiver that will receive at 434 Mhz and give an output the monitors can use (I'm not sure of the terminology here - what do you call the signal that is used by common VCRs and TVs through the phono/RCA style jacks? Baseband? Composite?)

I'm hoping to find a relatively inexpensive kit that will allow me to get this thing up and running. I don't have a lot of time before the event comes up, so I need to find a solution quickly. Suggestions of particular makers and model numbers would be appreciated. Price is definitely an issue here, so cheaper solutions would be preferred (as long as they work).

Also, can anyone recommend a good antenna to use on a car carrying the transmitter? I would like to come up with something that could be moved from car-to-car easily without drilling holes into the cars. Mag-mounts are definitely out of the question.

I have a related question for anyone familiar with ATV in the San Francisco Bay area. I understand that 434.0 is the input freq for an ATV repeater on Diablo. Is there likely to be any problem with running a transmitter that puts out 10-15 watts on 434.0 at Laguna Seca? I assume that it's far enough away not to cause any interference, but would like to be sure.

-> I'm NH6IL and I'm against the no-code license.
-
-I'm AA8IF and I'm in favor of the no-code license.

I'm N1IST and I'm in favor of the no-code license.

If it wouldn't have been for the no-code license, I probably would not be
a ham now. Once I got my no-code tech, got on the air, and found out what
ham radio was all about, I did sit down and learned the core (I'm an extra
now), but I still am not a big CW user. Most of our new members of the
Boston ARC got their start as no-coders, and they are doing fine. Certainly
no problems doing emergency communications at the Walk for Hunger last week.

Let's put this debate to rest once and for all. The no-code license is
here, and if you look at the numbers, most new hams are entering the
hobby that way. (And for all you worriers out there, many of them go
ahead and learn code later on)

73,
/mike

Kelly, I've made a Ham scanner out of my Ramsey FX-146. The frequency
is controlled by 16 lines and the range is 140 to 180 MHz. My June '92
73 magazine article, "8000 Channels for the FX-146", gives some ideas on
how to do it. You can scan any number of the 8000 channels. An additional
feature is if you hear someone during scanning that you would like to
talk to, just pick up the mike and give them (I hate him/her/it) a shout,
assuming, of course, they are Hams. If you're interested, send me your
address and I'll send you a sketch of what I did...KG7BK

From: dickrb@hplsla.hp.com
Message-ID: <20360154@hplsla.hp.com>
Source record: 281501

Greetings -

The SHARC (Soper Hill Amateur Radio Club whose members work for Hewlett-Packard in Everett, Washington) folks are looking for recommendations for a tranceiver to be used for QSO's thru the HAM satellites. Ideally, the radio we choose will allow control via computer so that it can be operated from a remote site by members of the club.

We want reports on the good AND the perceived bad tranceivers that are presently available on the new or used market.

Thanks,

Dick - W7WKR

>Thanks & 73... Mark AA7TA

I'm using a 25 ft. PVC mast for my vertical and it's quite
stable (Sched. 40, 1.75" dia.). Much higher than that though,
and the thing goes to mush (my mast is in 5 ft. sections, so
I add/delete as necessary).

I don't think the 2" dia. pipe would be good for 40+ feet,
Unless of course you could support the bottom half against
your house or a tree. Barring that, hunt for a larger diameter
pipe, or plant something that grows fast....

Good luck!

In article <1s9pl3$e84@network.ucsd.edu> jgervais@weber.ucsd.edu (Joe Gervais) writes:
>A few months ago there was a ham in Florida who apparently
>was having serious legal troubles regarding (I believe) their
>antenna. Has anyone heard anything of his/her current plight?

I spoke directly with the ham involved a few weeks ago. Here's my
understanding of where things are at:

The case is strictly a "civil" matter involving the ham(s), the neighbors
and the "sub-division" deed restriction. The affected ham's residence
is a single family detached dhome on one acre.

The deed restrictions have NO antenna restrictions, BUT there is
a broad restriction against noxious/annoying/etc. activity. It is
under that broad restriction that the judge has ruled in favor of the
neighbors who complained against the tower AND the actual amateur
radio transmissions by the ham.

At this time, the ham has been ordered by the judge to (1) remove
the tower AND (2) cease ALL amateur transmission from the
premises. The case is now being appealed and will likely take
some time before anything else happens.

For clarification, I again point out that this situation does NOT
involve any restrictive town/city ordinances or laws which PRB-1
could be used against. The most threatening aspect of this case
is that, if it stands, other deed restricted subdivision
homeowners may try to have a similar "ban" against ALL amateur
transmissions using the same argument that ham transmissions
are annoying, threatening, etc. Given the hyper-fear of electromagnetic
radiation these days, that could also become a battle cry of neighbor
against ham in the future. (Note, this entire post is my "understanding"
of the current situation. If anyone has additional details or any
correction to what I've posted, please post to the newsgroup.)

Please also direct any follow-ups to the "policy" newsgroup to
which I've cross-posted this response.

Here in the L.A. there will be a 900 mHz spread spectrum net work up and running in the very near future (3 to 4 weeks) . It will trans fer data at 3 meg baud. The soft ware and hardwareare off the shelf. The hard ware is a card that plugs into your IBM or clone. IT contains all the hardware needed including the radio, all you have to supply is the antennia of choice.
There will be a gateway to internet thru a local collage.
Windows for work groups will be able to use the hardware. The cards will work with Novel IPX.
Keep watching the net I will post a note and more information when the system is up and running.

Hot off the presses, the QRZ! Ham Radio CD-ROM contains the complete US CALLSIGN DATABASE (March 1993 Edition) complete with PC (MSDOS) compatible search and retrieval software, and tons of ham related material totalling over 500 Megabytes!

Some of the features include:

* March 1993 US CALLSIGN DATABASE (in ASCII)
* PC (MSDOS) compatible search and retrieval software
Search by callsign, name, city, zipcode, several output formats including screen, mailing lists, etc.
* ISO 9660 CD-ROM Format - readable on all systems
* Hundreds of popular ham related (shareware) programs
* Nearly 200 radio and scanner modifications
* USENET news articles from rec.ham-radio and rec.radio.amateur.{misc,packet,policy} since 1989
* Complete dumps of several internet ham radio archives
* Canadian and US CLUB callsigns
* FCC Rules and Regulations (Part 97)
* DX lists, DXCC info, BBS Lists
* UNIX callsign database/server 'C' source code
* SIMTEL20 Ham Radio Archive Files
* Vast amounts of useful reading information for the beginning to the advanced ham

The list price of the QRZ! CD-ROM is $24.95. As a special thanks to the USENET community, we are making the QRZ! Ham Radio CD-ROM available at a special price of $15 (US) plus $4 shipping and handling per order. All CD's will be mailed First Class Priority mail (this costs us $2.90 in postage) which reaches most US addresses in 2 or 3 days on average. Those ordering multiple copies pay the $4 only once per order.

Overseas orders will be accepted at the same $15 (US) price, but with a $10 shipping charge.

Quantity discounts are available for orders of 10 or more.

A complimentary copy is available to each of those whose contributed shareware appears on the CD.

Ordering Info:

US: Send a check or money order (preferred) for $19 ($15 + $4 s/h)

Overseas: Send a money order for $25 (US funds) ($15 + $10 s/h)

Make all checks payable Fred Lloyd and send to:

QRZ! c/o Fred Lloyd
8215 E. Wood Drive
Scottsdale, AZ 85260

NOTE: This one-time offer is available only to persons who are
actually on USENET (must have a reachable e-mail address).

Questions, comments, etc. via e-mail to Fred.Lloyd@West.Sun.COM

I tried 20 foot sections of 3 inch white PVC pipe to hold
up the legs of a long wire V-Beam. BIG mistake. It bends
like a noodle in time and is now guyed to try to keep it
straight.

You might look at Alford slot antennas. There was an ad for one in
the last Spec-Com...

I have used one, and they work, _if they're tuned correctly_. I assume
you're looking for omnidirectional antennae with a little bit of gain.

You might also want to look at an "egg-beater" design. They work
pretty well, too, especially if they have a reference ground plane
1/4 wavelength down the mast.

We are seeing these here in this college town as well - I've probably seen 3 cars with them so far. I do believe they are of the neon variety - so far I've seen blues and greens.

One car had so many tubes of it that it looked somewhat like the DeLorean from "Back to the Future" going into timewarp :-)

I didn't have the rig on though, so don't know about the interferance. Actually if this is common I'm a little disappointed. I saw one car with a tube around the back license plate (green) which looked like it might be kind of a nice safety feature (similar to the high level brake lights you see). These things must be pretty commonly available. Anyone know where they are coming from?

-=-=-=

"BAND" button. This swaps the left and right displays. When dual in-band receive is active, the "BAND" button changes both the main and sub receivers from 2m to 440 or from 440 to 2m. Arrrgh!!!! I would prefer a "SWAP" button to swap left and right regardless of mode. (The "SUB" button is used instead.)

Automatic backlight dim: works as advertised but the backlight level under low ambient lighting is WAY too low. Manual control is the best solution.

DTMF page: works as advertized, but the *&%$#@ thing insists on "ringing" like a phone EVERY time it receives the page sequence. This means that you have to co-ordinate with the other station to turn the *&%$#@ DTMF stuff off at the same time or tolerate the "ring" at the start of every receive.

CTCSS decode: squelch opens quickly when normal CTCSS decode (an option) is enabled. There is a CTCSS page function that has a distinct delay between receipt of carrier with CTCSS and open squelch. I don't yet understand the use of this "feature."

There is no SCAN button on the front panel. Scan is initiated by holding the up or down button of the mike down for two seconds. The scan is blindingly fast when compared to the Alinco 590 that I used to have.

Memory: memory is divided into four "banks." Two for VHF, two for UHF. Only one bank can be active for each receiver. I consider this an advantage, but you may not. There are two obvious (to me) uses for this configuration. First, you can store frequencies for different uses in different banks. Second, you can activate one 2m(440) bank in the main receiver and one the other 2m(440) bank in the other receiver and scan them simultaneously.

Heat management: After seeing the HUGE heat sink on the back of the Alinco 590, the Yaesu 5100's sink seems too small. In a key down experiment, the heat sink of the Yaesu got almost too hot to touch before the fan kicked on. If I were planning to run a packet station, I would definitely look into some extra forced air over the back of this one. As it is, I'm a bit concerned about how hot it will get mounted in my dashboard. [Others people don't seem to have this problem.]

DTMF Decode and Scan: If you have CTCSS decode (an option) enabled on a memory and you are scanning and there is activity on that frequency but without the correct CTCSS tone, the 5100 stops scan, flashes the strength meter and then continues scanning. It is slower than normal scan, but still quite fast.

Attributed: Brian McMinn, N5PSS, brian.mcminn@amd.com

-=-=-=

Tech Manual:

The technical manual for the 5100 is [information wise] pretty spare. No additional operating notes or hidden secrets are revealed. It is worthwhile for the alignment notes and complete parts list. Call the number in your owners manual to order.

Attributed: Bill Mayhew, N8WED, wtm@uhura.neoucom.edu

-=-

DTMF decoding:

Effect: display decoded DTMF tones

Note: [ed] this works on the FT-530, but not on my 5100. I'm including it here on the chance that it works on the 5200. Please try it on your 5200 (or 5100) and tell me if it works for you.

1) Select frequency and turn on the code squelch
2) Press Function-Page(Code) to select a code memory
3) Dial up to memory #7 [the 5100 won't do this]
4) Watch the dtmf's scroll by as they are heard by the radio!

Attributed: jmeyers@ecst.csuchico.edu (Jeff Meyers)

-=-

Crossband Audio Enhancement:

Effect: unmuffle crossband audio

Connect a 27K ohm resistor between the audio-in and audio-out leads on the data jack (inside the shell of a mini plug, that is). The mic element stays live while in crossband operation. It is a good idea to remove the mic from the rig while cross banding if you need/want to eliminate ambient audio.

Attributed: Bill Mayhew, N8WED, wtm@uhura.neoucom.edu

-=-

Wireless Mike (review):

The wireless mike sends audio over 49.85MHz, so it is can't be used in high RF environments (like near computers). It duplicates ALL front panel controls with the exception of the power button.

It interfaces to the rig via a standard mic plug. The receiving unit is only about 1'h x 2w x 1/2d.

[ed] The implications of this are that the entire radio can be controlled via the microphone port! Too bad there isn't a fancy *wired* mike with all the controls on it.

Several people have reported trouble with the mike -- enough trouble for them to return it because of poor range and poor audio. It works well if you sit on top of the pickup unit, but then you don't need a wireless mike.

Attributed: Tony Pelliccio, KD1NR system@garlic.sbs.com

-=-=-=

NOTE If you want to change the D/MR button on the
microphone to do Band Switching, now is the time.
See the next mod.

8) Install front control head, speaker, top and bottom covers
and reconnect power to the radio.
9) Press and hold [D/MR] [F/W] [REV] keys and turn on the radio.
Radio will now show 300.000 & 20.000 on display.
10) Set UHF Rx Low - Press [MHz] and dial 420.00, press [D/MR]
11) Set UHF Rx High- Press [MHz] and dial 475.00, press [D/MR]
12) Set UHF Tx Low - Press [MHz] and dial 420.00, press [D/MR]
13) Set UHF Tx High- Press [MHz] and dial 450.00, press [D/MR]
14) Set VHF Rx Low - Press [MHz] and dial 128.00, press [D/MR]
15) Set VHF Rx High- Press [MHz] and dial 180.00, press [D/MR]
16) Set VHF Tx Low - Press [MHz] and dial 140.00, press [D/MR]
17) Set VHF Tx High- Press [MHz] and dial 150.00, press [D/MR]
18) Set UHF offset - Press [F/W] then [RPT] dial 5.000 press [RPT]
19) Set UHF tuning - Press [F/W] then [REV] dial 25.0 press [RPT]
20) Set VHF offset - Press [F/W] then [RPT] dial 0.600 press [RPT]
19) Set VHF tuning - Press [F/W] then [REV] dial 20.0 press [RPT]
(VHF tuning step varies by state -- many use 15.0)

Diagram: [there are no tabs in this section - ed]

Ok, here's where it gets tricky, but so you know, a '|'
represents a jumper.

g7ltq@g7ltq.ampr.org

-=-=-=

The radio's alignment was done at the factory for your original frequency bands and so there will not be optimum behavior outside these ranges. Broadening the alignment will sacrifice performance at usual frequencies. In practice, the alignment does not need adjustment.

You can program the frequency limits now. [ed - note the similarity (and dissimilarity!) to the 5100's program-limit sequence above]

3) Press and hold [D/MR] [F/W] [REV] keys and turn radio on.
4) Program in VHF low edge of Rx
VHF high edge of Rx
VHF low edge of Tx
VHF high edge of Tx
5) Repeat for UHF in the same order.

I [John] have not done this so I can give no further advice on programming.

Attributed: John Newgas, G7LTQ jnewgas@cix.compulink.co.uk g7ltq@g7ltq.ampr.org

-=-=-=

for which the rig was intended. Note the arrangement if
you ever want to un-modify your radio.
5) Using a fine-tip soldering iron, set the jumper spots as
follows:

1 closed
2 closed
3 closed
4 open
5 closed
6 closed
7 closed

6) This completes the alteration for frequency expansion.
Reassemble the radio.
7) Reinitialise the radio by simultaneously holding D/MR, F/W,
REV and POWER. You must now program in the band limits.
The display will show a blinking "1" in the left-hand
memory box and "000.000" in the left-hand frequency
display. (Ignore the right-hand display for now). The
following limits are suggested, but the RF circuitry of the
rig will only cover slightly less. Use the dial or up/down
buttons to select the frequency and then press D/MR to
store it. The blinking "1" will increment.

VHF rx: 137.000 174.000
VHF tx: 137.000 174.000
(display will show blinking "1" and "300.000")
UHF rx: 410.000 470.000
UHF tx: 410.000 470.000

(Note: it is possible to set the RX limits wider than the
TX limits; for obvious reasons you cannot have the reverse
situation).
8) You can repeat step 7 above at any time if you need to
change the limits.
9) The pre-set repeater offsets are now no longer available
and you will have to set them up manually using the
instructions on page 16 of the manual. The Automatic
Repeater Shift (ARS) feature (also on page 16 of the
manual) will also have disappeared and you will have no way
of getting it back (except by changing the jumpers back).

To enable the crossband repeat, remove the link at
jumper spot 17. (Note, just below jumper spot 17 is a
separate jumper spot, not part of the group of twenty -
leave this alone).

Attributed: Hugo Cornwall

-=-=-=

Effect: enable crossband repeat

[ed - this is a continuation of the above]

1) You can enable the crossband repeater without altering the
frequency coverage. The only hardware alteration is the
removal of link 17.
2) To enable, turn on rig while holding down [RPT] button.
The rig is now a crossband repeater - you will get
confirmation of this from the display: the 100s position on
the two frequency displays will be replaced by a "R".
3) While in cross-band repeater mode you can change the
frequencies of each band.
4) The crossband repeater suffers from desense. It works
better at low power and even better if you use an external
diplexer and separate antennas. The more isolation between
the two bands, the better. As with all cross-band
repeaters, results will be poor if the UHF frequency is a
direct multiple of the VHF frequency. If you are planning
extended use of a crossband repeater, make extra sure that
the rig is adequately ventilated.

==========

Remote Control Mike Interface (5100, maybe 5200):

Effect: remote (wired) control of radio

The Remote Control Mike (from Yaesu) uses a serial data stream
interface in the microphone jack to control the 5100. This
simple hardware interface allows a computer to control the
5100 in the same way. It is somewhat similar to the CAT
interface I have built for my FT-757 HF rig, but mostly like
the interface described in the FT-912R manual (loaned to me
via a friend from Yaesu). When using my PC as the source for
the serial data, I used a MAX232 chip for a level conversion
between the +/- 12 volts levels on the computer and the 0-5
volt levels on the radio.

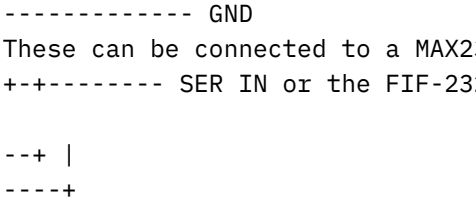
The serial data parameters are 4800 N82. The commands sent to
the radio are simple one byte instructions. The RMC mode ON
command (16) must be sent before any other command. When the
RMC mode is ON, a small LCD "RMC" icon will light on the
display (see owners manual under Display). Also, the Vol,
Sql, and Bal knobs are disabled when in the RMC mode because
they will be controlled via serial commands, but all other
buttons are still active.

The commands are as follows:

0 - RPT 12 - CALL 24 - SQL Up
2 - REV 14 - BAND 26 - VOL Up
4 - MHZ 16 - RMC 28 - BAL Right
6 - D/MR 18 - SUB 30 - BAL Left

8 - TONE 20 - PAGE 32 - SQL Down
10 - LOW 22 - F/W 33 - VOL Down

The interface I built simply wired mike port pin 7 to serial ground and pins 1 and 3 each through a diode then together, to the serial source. Note: I am not a hardware person! Use this hardware at your own risk.



You can wire 1 and 3 together first, then through 1 diode, but that disables the UP and DOWN buttons.

I'll continue to study this more. If anyone would like to know more, or has any corrections or feedback, please email me.

The concensus of those discussing the TM741A mods some time back, was that if you removed R54 and R55, you should also CUT the green wire. Kenwood had printed some instructions that said to not to cut it, but the result was poor sensitivity, birdies, etc. Perhaps this is related to your problem?

If all recievers that can automatically switch between more than 3
channels and hear the cell band are illegal (or will be next year) to
produce. What about the phones themselves were they exempted? They can
switch between all the channels automatically. As far as listening in
manually like the article describes, it is usually only one channel at a
time. On the Radio Shack phones you have to type in the CHANNEL # to
monitor or transmit on.

I've got an alternate method that you might want to
try. But I want you to note that I have NOT tried
what I'm about to suggest. It could be a complete bust.

I seems to me that using three 1" or 2" lengths of thick
walled plastic pipe which have been strapped together might
be stiffer and more stable than a single 4" pipe. Though I
don't know if they would be stiff enough for a forty foot
mast. You could also try epoxying or gluing together the
pipes along their entire lengths. Or, find some sort of
adhesive backed material that you can helically (or is that
spirally) wrap around the whole mast. This would stiffen it
even more and protect the PVC from UV light.

This might not be a new or original idea. If anyone actually
builds something along the lines I've suggested please let me
know about the results.

2114. THE CALLSIGN DATABASE CD-ROM IS READY!

Newsgroup: rec.radio.amateur.misc
Date: 1993-05-06 23:30:10 UTC
From: flloyd@sunburn.Corp.Sun.COM
Message-ID: <1sc722INNc3q@west.West.Sun.COM>
Source record: 282077

Yes folks, the CD many of us have been waiting for is finally ready.
My personal thanks to all those who contributed time, effort and
suggestions to help make this a reality.

-fred, AA7BQ

* * * Announcing the QRZ! Ham Radio CD-ROM * * *

Hot off the presses, the QRZ! Ham Radio CD-ROM contains the complete
US CALLSIGN DATABASE (March 1993 Edition) complete with PC (MSDOS)
compatible search and retrieval software, and tons of ham related
material totalling over 500 Megabytes!

Some of the features include:

* March 1993 US CALLSIGN DATABASE (in ASCII)
* PC (MSDOS) compatible search and retrieval software
Search by callsign, name, city, zipcode, several
output formats including screen, mailing lists, etc.
* ISO 9660 CD-ROM Format - readable on all systems
* Hundreds of popular ham related (shareware) programs
* Nearly 200 radio and scanner modifications
* USENET news articles from rec.ham-radio and
rec.radio.amateur.{misc,packet,policy} since 1989
* Complete dumps of several internet ham radio archives
* Canadian and US CLUB callsigns
* FCC Rules and Regulations (Part 97)
* DX lists, DXCC info, BBS Lists
* UNIX callsign database/server 'C' source code
* SIMTEL20 Ham Radio Archive Files
* Vast amounts of useful reading information for the
beginning to the advanced ham

The QRZ! disk is being supplied by Walnut Creek CD-ROM. You must contact
them directly, using the info below:

If you want more details about this disc, you can ftp the readme and index
from cdrom.com:/pub/cdroms/ham.

The price is $25. S&H is $5 for US/Canada/Mexico, and $10 for overseas.
If you live in California, please add sales tax. You can pay by check,
money order, Visa/MC/Amex, gold bullion, small unmarked bills, etc.

Bob Bruce
Walnut Creek CDROM
1547 Palos Verdes Mall, Suite 260

Walnut Creek, CA 94596

1 800 786-9907
1 510 674-0821 FAX
orders@cdrom.com

Many of the programs on this disc are shareware, and require seperate payment
to the author for continued use. If you are dissatisfied with the disc for
any reason you can return it for a full refund.

Here is a list of some other CD-ROM titles published by Walnut Creek CDROM:

CICA Microsoft Windows CD-ROM - Shareware collection from Ind Univ $25
Simtel20 MSDOS CD-ROM - shareware/PD swr collection $25
GIFs Galore - Thousands of GIF images $25
Hobbes OS/2 CD-ROM - shareware & PD swr collection for OS/2 $25
Garbo MSDOS/MAC CD-ROM - shareware & PD for DOS and Mac $25
Sprite CDROM - Sprite Research Operating System $25
Nova CDROM - NeXT Workstation software $40
Source Code CD-ROM - Usenet source archives on CD-ROM $40
X11R5 and GNU CD-ROM - X11R5 Window System Source $40
C User's Group Library CDROM - C source code $50
Libris Britannia - British shareware $69

For a more detailed list, you can ftp the latest catalog from
cdrom.com:/pub/catalog, or send email to info@cdrom.com.

Last June I got my Jeep stuck in a snowdrift that was across
a "usable access road". I also used several sites that
were accessible by 4WD only or at least a high-clearance
vehicle with mud/snow tires. June is just barely summer above
10,000 feet.

There certaintly is a speed tradeoff when you wander back in
off the paved highway. But then again you don't get as many
tourists staring at you while you operate.

DEFINITIONS:

Date (day only)
10.7 cm SOLaR radio FLuX forecast
HF Propagation Conditions for LOw, MIddle, HIgh, and POlar areas (see below)
HF Short Wave Fade Probability (in %)
HF Maximum Usable Frequency in +/- percent above seasonal normals.
HF Prediction CONfidence Level (in %)
VHF Sudden Ionospheric ENHancement Probs (in %), weighted for low-mid lats
PROBability of "s"poradic E (Es) during the UT day for low, mid and high lats
VHF AUroral BacKScatteR Probs (in %) for LOw, MIddle and HIgh Latitudes
VHF Overall Global DX Potential (in %) - weighted for Low and Middle latitudes
Geomagnetic Activity Kp Index (peak value - see below)
GeoMAGnetic Activity Ap Index (peak value - see below)
```

AURORAl Activity for LOw, MIddle and HIgh Latitudes (see below)

HF Prop. Quality rated as: EG=Extremely Good, VG=Very Good, G=Good, F=Fair,
P=Poor, VP=Very Poor, EP=Extremely Poor.
Probability of Sporadic E (Es) for the various latitudes is given in percent.
Kp Planetary Index rated: 0=V.Quiet, 1=Quiet, 2=Unstld, 3=Active, 4=V.Active,
5=Minor Storm, 6=Major Storm, 7=Maj-Sev Storm, 8=Severe Storm, 9=V.Severe.
Ap Planetary Index rated: 0-7=Quiet, 8-16=Unstld, 17-29=Active,
30-49=Minor Storm, 50-99=Major Storm, Severe Storm >=100.
Auroral Activity rated: NV=Not Visible, LO=Low, MO=Moderate, HI=High,
VH=Very High.

PEAK PLANETARY 10-DAY GEOMAGNETIC ACTIVITY OUTLOOK (07 MAY - 16 MAY)

| Geomagnetic Field |Fri|Sat|Sun|Mon|Tue|Wed|Thu|Fri|Sat|Sun| Anomaly |
| Conditions | Given in 8-hour UT intervals | Intensity |
|_____________________________________________________________________________|
```

CONFIDENCE LEVEL: 60%
NOTES:
Predicted geomagnetic activity is based heavily on recurrent
phenomena. Transient energetic solar events cannot be predicted reliably over
periods in excess of several days. Hence, there may be some deviations from
the predictions due to the unpredictable transient solar component.

60-DAY GRAPHICAL ANALYSIS OF GEOMAGNETIC ACTIVITY

-------------------------------------------------------------
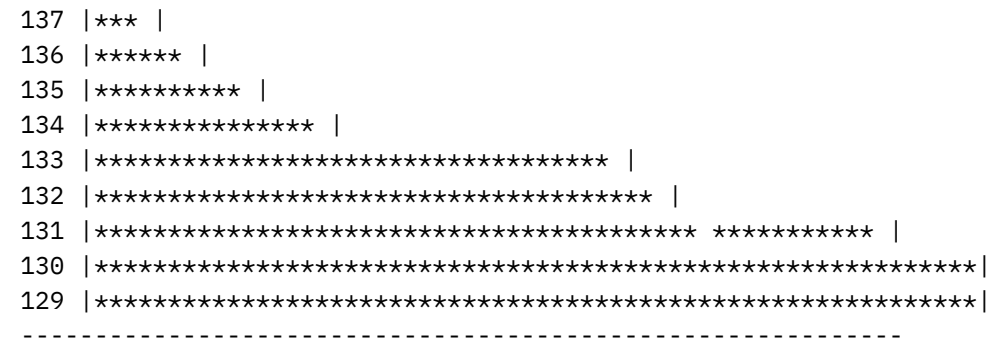
Chart Start: Day #068
```

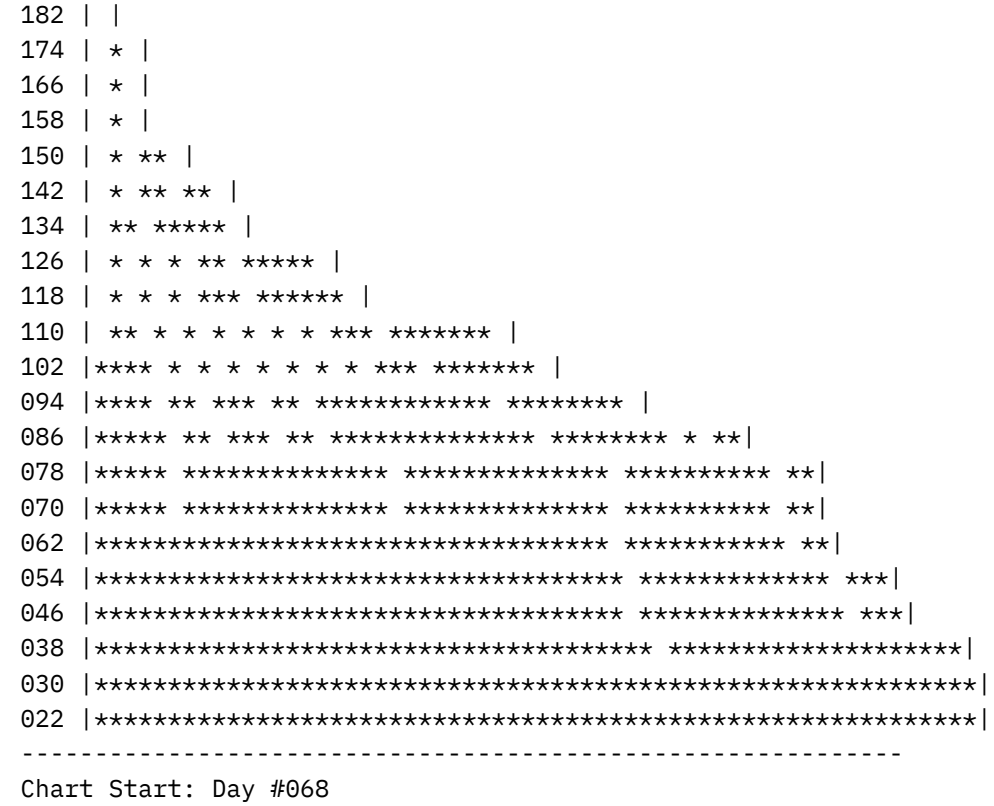
GRAPHICAL ANALYSIS OF 90-DAY AVERAGE SOLAR FLUX

```
-------------------------------------------------------------
138 | |
```



NOTES:
The 10.7 cm solar radio flux is plotted from data reported by the Penticton Radio Observatory (formerly the ARO from Ottawa). High solar flux levels denote higher levels of activity and a greater number of sunspot groups on the Sun. The 90-day mean solar flux graph is charted from the 90-day mean of the 10.7 cm solar radio flux.

CUMULATIVE GRAPHICAL CHART OF SUNSPOT NUMBERS



NOTES:
The graphical chart of sunspot numbers is created from the daily sunspot number counts as reported by the SESC.

NOTES:
These VHF DX prediction charts are defined for the 30 MHz to 220 MHz bands. They are based primarily on phenomena which can affect VHF DX propagation globally. They should be used only as a guide to potential DX conditions on VHF bands. Latitudinal boundaries are the same as those for the HF predictions charts.

>So, to double F you need to halve sqrt(LC), according to the
>formula.

Yes, and that requires scaling each of L and C by 1/1.4142135..
or 1/sqrt(2).

>Or, squaring both sides, F^2 is proportional to 1/LC

Yes, or written another way to express the ratio: F1^2/F2^2=(L2*C2)/(L1*C1)

>Note that if you make 1/L proportional to F and 1/C proportional
>to F you get an *exact* scaling. Pretty convenient, IMO.

Yes, but the proportionality isn't a linear relationship, as you noted
above, it's actually F^2 that's proportional to 1/LC. Don't confuse
equal reactances with equal inductances and capacitances.

>It seems that Gary has botched the math. Fortunately, I have
>lots of patience. :-).

Fortunately I have equal patience. I don't think I botched the math,
you botched the concepts by making the leap from F^2 proportional to
1/LC to F being proportional to 1/L and 1/C. That's true, but it's
only true for the combination if you scale *one* of L or C, not when

you scale both at the same time. Then you must consider the squared
terms and the scaling factor becomes F1^2/F2^2. Hmmm, I did botch
the math, F1^2/F2^2 isn't the same as sqrt(F1/F2). But it's not the
same as simply scaling both L and C by F1/F2 either as you propose.

>>>However, stuff like input and output impedances often vary
>>>with frequency unless feedback is used to control them. Thus,
>>>the networks may have to changed to accommodate the new impedances.
>>

Ok.

>I must say that associating terms like "feedback" or "control"
>to passive LC circuits is a bit unusual. You working on something
>really exotic?

Not me, you introduced the subject, note the nesting level. I just
commented that you can keep the passive network's impedance transform
constant by scaling both L and C together. If that's not your design
goal, don't do it that way.

Gary

Actually yes I would prefer that the hobby go that way. At least
amateur radio operators wouldn't be known as a bunch of CB'ers who had
to memorize the questions so they could talk to their "good buddies"
across town on 2 meters. Spectrum might have been lost, but so what?
If it is unused, nobody will miss it. What's the point of keeping it if
it goes unused.

> Be careful who you call a scumbag. I am not just some ex-CBer - I've been

What the hell do vaccum tubes have to do with code? It should have been
made a "digital" license like it was supposed to be, but now we have
moronic CB'ers all over 2 meters and 70 cm. I know I could ask most of
the no-codes around here how to constuct a dipole and all they would do
is say, "go buy one, der". Granted there may be a few worthy
individuals who are intelleignet but largely around here they are
idiots. They are a disgrace to the proud tradition of amateur radio.
I'd rather lose it all then relinquish it to CB type operators. GAG!

It's a joke of a multiple guess exam anyway. Even the exam is given
away. Why don't they just turn it into CB now and sell even more
radios! Damn low rent, bottom feeding, simplistic scumbags! They deserve
nothing!

Well how the hell would you know? What have you been licensed for, all of a couple years! I know many more hams than you that were licensed before NO-CODE and most agree with me! Like I said, a survey of hams would be shewed because of the current no-clues! It's not like code is even difficult. They are just lazy people would couldn't hack it! Either GET IT DONE or GET LOST!

Good job. I upgraded to extra around 18 myself. I am a 24 year old
college grad now and am glad I got my license back then. I had calculus
in high school so at least I understood the match in the exams. There
are idiots out there which are high school dropouts and they are passing
exams with trig and the like. Gimme a break! We need to change the
exam format at the very least to something that CANNOT be memorized.
That will keep many of the simpletons away. They can stay on 27 MHZ!

Well the ARRL did not support no-code for the longest time and I have
oodles of QST ariticles to prove it. Then they did an about face
because of the $$$. ARRL does not represent a majority of hams anyway.
Gee let me think TAPR and AMSAT usually utilize frequencies above 50
MHZ. Of course they are gonna support something that increases their
membership whether or not it is good for the hobby. Increasing
membership is not necessarily a good thing in and of itself anyway.
Just listen to two meters and 70 cm. They are a disaster around here.
Jamming and intenonal interference have increased sharply aounrd here.

I supported a no-code "digital" license in the beginning. But now voice
and who knows what's next. My father has been licensed since 1957 and
he thinks the no-codes are a joke too. So don't think that because QCWA
supported it (probably with ARRL's prodding) that "most" hams in the
hobby for over 25 years agree with you. That is an invalid conclusion.

Sure incentive licensing makes sense. The idea was put forward to
increase the number of persons who had a special skill such as Morse
Code. Anyone can press a mic button and blab.

Even if code was dropped all together as an exam requirement (can't be
done because of international agreements) the exmas should at least be
made worthy of the knowledge an amateur radio operator is suppose to
posess.

Tom, your mention of Amateurs being excluded in many laws from scanner bans brings up an interesting point. Since most modern amateur transceivers sold today are 'scanners,' it might be impossible for municipalities to ban their use by liscensed amateurs, since we have federal permission to operate such equipment.

This begs the question, did politicians who made the exclusions for amateurs do it because they thought it was appropriate for amateurs to be able to use scanners? Or(more likely in my eyes) did they do it to keep their Nazi laws from being struck down in federal court.

As always more informed opinions requested(particularly from the legal minded)

Hmm, gives me an idea Daniel. Seems to me this anti 800mhz scanner
law also bans...get this...all the POLICE (and other public service) 800
mhz trunking equipment. Certainly all these trunked radios have scanning
receivers and could no doubt be easily reprogramed for the cellular
bands.

Just another comment on our congresscritters' stupidity.

2126. Re: Kenwood 741 Out of Band Problem

Newsgroup: rec.radio.amateur.misc
Date: 1993-05-07 05:52:47 UTC
From: David Billstrom <daveb@ssd.intel.com>
Message-ID: <C6n6zz.4tt@SSD.intel.com>
Source record: 281991

I!ve been struggling with this on my 741 for about a year now -- and even sent it back to Kenwood under warranty for a complete check-out. In our area we have a huge amount of data radio on 520+ MHz (like the local transit system -- always guaranteed always to be somewhere nearby!); 800-900 MHz; as well as TV cable audio -- and all of this could actually be heard intelligibly if you listened closely on the UHF of my 741.

In addition to what has been previously posted, we!ve done some side-by-side comparison of several 741s in the last couple of months and learned:

1. Not all models are equal, and newer rigs (higher serial numbers) have apparently had some of the sensitivity narrowed in UHF (but the basic problem is still there).

2. Not all CTCSS tone boards are equal -- with some not decoding correctly and reliably. We found that Kenwood would replace defective modules when the problem was provable WITHIN the amateur bands, but didn!t have any sympathy when they would not reliably decode above the ham bands. A number of the boards did not decode when used above 450 MHz.

HOWEVER... This evening we found a partial solution on the UHF sensitivity problem: Inadvertently, we found that a Comet Duplexer -- placed between the antenna and the 741 -- will limit nearly all of the intermod and noise in the UHF receiver. Previously marginal stations now punch through, and several repeaters that I didn!t even know where there are now audible.

How it works: on the UHF side of the duplexer, it bandpasses everything up to 500 MHz. This severely limits the susceptibility of the 741!s UHF receiver to pull in extraneous signals (like all the intermod and various harmonic trash) above amateur. The result is very clean UHF reception, including some of the public safety frequencies in the 460-464 area.

In other tests with the duplexer in line, we found that the cross-band repeat of the 741 actually worked better with a Larson dual-band antenna and the duplexer instead of separate 440 and 144 antennas (as I had it rigged before). Why? The separate antennas are only 3 feet apart (I!m guessing 20 dB separation), but the duplexer specs are 60 dB of separation! I!m not a salesperson for Comet, but I have been convinced. I recommend this for anyone with a 741 or considering buying a 741. Not cheap, but a workable solution.

So, no more UHF noise and intermod; less de-sense when in cross-band repeat; one less antenna on the roof. I like my 741 again.

Europe has a band allocated for 'low power' control devices in the
433-434MHz band (I can't remember the exact allocation) and your transmitter
is probably intended for this side of the pond. Fortunately for the UK,
the authorities were not in favour of the allocation and have said they will
be on our side if there are any problems (I hope they remember it when their
help is needed!) with interference.

I did suggest that we should allocate 433.925 to packet radio.........

2129. Announcement - ARRL Information Mail Server (info@arrl.org)

Newsgroup: rec.radio.amateur.misc
Date: 1993-05-07 07:41:09 UTC
From: ehare@arrl.org
Message-ID: <rec-radio-info736841295@ve6mgs.ampr.ab.ca>
Source record: 281921
Cross-posted to:
rec.radio.amateur.misc,rec.radio.cb,sci.electronics,comp.misc,rec.radio.shortwave,k12.ed.science,alt.radio.scanner,rec.radio.info

The American Radio Relay League (ARRL) has a useful service -- the ARRL
Information Mail Server. This is an automated mail server that let's you
access many of our information files, containing information about various
facets of Amateur Radio. You can retrieve any or all of these files by
sending an email message to info@arrl.org here at ARRL HQ. Each file you
request is then mailed to you automatically, usually within a few hours.

To use it, mail messages to:

info@arrl.org

Each line of the message should contain a command as shown below.
You may place as many commands in a message as you want. Each file
you request will be sent to you in a separate message. Only ASCII
text files are supported at present.

Valid INFO commands:

help Sends this help file
index Sends an index of the files available from INFO
send FILENAME Sends "file" example: send email
quit Terminates the transaction (use this if you have
a signature or other text at the end of the message.)
reply <address> Sends the response to the specified address. Put this
at the BEGINNING of your message if your From: address
is not a valid Internet address.

Note: your message will *not* be read by a human! Do not include any
requests or questions except by way of the above commands. Retrieve
the "EMAIL" file for a list of addresses of ARRL HQ humans :-)

In article <C6MLAM.CBF@news.iastate.edu>, njohnson@sysad.cnde.iastate.edu (Neil Johnson) says:
>
>I will be going on a Trip to Germany soon. Is there anyway I can get a y
>temporar
>license so that I can operate while I'm there?
>
There certainly is, provided you're not going within the next 2 or 3 weeks.
Write to the DARC (the German equivalent of the ARRL) and they'll arrange
things for you:

DX Bulletin 23 ARLD023
>From ARRL Headquarters Newington CT
May 6, 1993
Relayed by KB8NW/OBS & BARF-80 BBS
To all radio amateurs

SB DX ARL ARLD023
ARLD023 DX news

Thanks to Bob, W5KNE; QRZ DX; Chod, VP2ML; the DX Bulletin; and the
YCCC PacketCluster Network for the items in this week's bulletin.

LIBYA. Late May is the earliest we can honestly expect this
operation to start. Ops include Romeo, 3W3RR/AH0M; LZ2UU and LZ2PO.
RT5UL of D2ACA fame may also join up. This DXpedition will operate
from near the city of Darnah on the Mediterranean Sea.

ERITREA. The independence referendum vote in late April was passed
by a 99 per cent margin. Italy was the first country to recognize
the independence of this new country. The Provisional Government
has announced a separation date of May 24, 1993. Expect much
operation soon after, as several groups are poised to go. The DX
Advisory Committee, DXAC, has the matter of country status under
consideration now.

SPRATLY ISLANDS. Expect the postponed March operation of 9M0S to be
up and running for about one week, sometime around May 25.

MICRONESIA. V63DX by JA7IHZ, and V63CW by JH7IOS, will both start
May 26 and run until June 1. They plan to operate 160 through 10
meters and be very active in the CQ WW WPX CW Contest. QSL via
their home calls.

ITU HEADQUARTERS, 4U8ITU. Wolf, DK7UY, has been worked on CW, SSB
and RTTY. He is concentrating on 20 and 17 meters, so try 14084 kHz
between 2200 and 2345z, and 18075 kHz around 1600z. Luc, I1YRL,
will be active from the ITU Hq station during May.
```

UGANDA. 5X1XT has been on 14 MHz RTTY and CW between 0400 and 0500z. 5X1XX was worked on 80 and 40 meter CW from the east coast between 0200 and 0330z. 5X1DX seems to favor phone at 14200 kHz around 0400z. QSL via N3JCL.

EQUATORIAL GUINEA. Ed, 3C1TR, is active afternoons on the 14226 kHz Family Hour Net. The new QSL manager for this one is K8JP.

LEBANON. OD5/SP7LSE has been busy on 14 and 18 MHz CW. Look for him on 20 meters between 2300 and 0200z, and 17 meters around 1308z. QSL via SP7EJS.

PAPUA NEW GUINEA. P29DK has been on 40 meter CW around 0830z on 7012 kHz.

SOMALIA. T5AA has been in a net on 14247 kHz between 0100 and 0200z.

THIS WEEKEND ON THE RADIO. Here is your menu of operating events.

The CQ-M Contest, the Russian Peace to the World event, runs for 24 hours starting at 2100z on May 8. The Danish SSTV Contest, sponsored by the Danish SSTV Group, is a 48 hour event that starts at 0000z on May 8. The Massachusetts QSO Party runs between 1500z on May 8 until 2100z May 9. For more information on these three events, check Contest Corral on page 107 of April QST.

A. Volta RTTY DX Contest, sponsored by the Italian Amateur Radio Association, ARI, is a 24 hour event starting 1200z on May 8. The Nevada QSO Party, sponsored by the Frontier ARS, starts at 0000z May 8 and runs until 0500z May 9. Details for these two events appear on page 128 of May QST.

GL and happy contesting.

ARRL Bulletin 51 ARLB051
>From ARRL Headquarters
Newington CT May 6, 1993
To all radio amateurs

NOVICE EXAMS BY VECS

The FCC has placed Novice Class examinations under the Volunteer
Examiner Coordinator program. As with other class amateur license
exams, responsibility for both preparation and administration of
Novice exams will lie with the VEC system, in the interest of
integrity, simplification and efficiency, the FCC said today.

The commission also will allow recovery of out-OF-POCKET costs for
coordinating and administering Novice examinations.

The examination elements required for the Novice license are already
being administered in the VEC system because they are also
requirements for other classes of amateur operator licenses.

The FCC said that placing Novice examinations under the VEC system
would avoid confusion caused by having two different systems result
in fewer errors in exam administration and in paperwork (including
allowing simplification of the FCC Form 610) and improve the
availability of overall data on examinations.

This action, in PR Docket 92-154, was taken May 3. No effective
date for implementation was announced.

Rec.radio.amateur.misc Frequently Asked Questions
Part 1 - Introduction to the FAQ and Amateur Radio
------------------------------------------------------------------------------

This is a regular posting of frequently-asked questions (FAQ) about Amateur
Radio, also known as Ham Radio. It is intended to summarize some common
questions on the rec.radio.amateur.misc newsgroup and Info-Hams mail list
as well as to help beginners get started.

Please provide a copy of the FAQ to any new or soon-to-be Hams you know.

Regular FAQ postings can help save network bandwidth and maintain a good
signal-to-noise ratio in the newsgroup. However, they can't do it alone - you,
the reader, have to use them. If you are a new user, please print and review
the FAQ articles and look at the instructions in the news.newusers newsgroup
before posting any articles. If you are an experienced user, please help by
refraining from answering frequently-asked questions on the newsgroup if they
are already answered by the FAQ articles. Instead, send e-mail to the user who
asked the question. (It will be helpful if you include the part of the FAQ
that answers their question, but not the whole thing.)

The FAQ cannot always prevent people from posting repetitive questions. But
even if hundreds of questions get posted, it saves you from having to answer
them hundreds of times. Also, a friendly pointer to the FAQ in your first
answer can help that person refer to the FAQ in the future. That is when we
can begin to get a real savings of network bandwidth.

To reduce the size of each article, the FAQ information is posted in 3 parts:
Part 1 - Introduction to the FAQ and Amateur Radio
Part 2 - Amateur Radio Organizations, Services, and Information Sources
Part 3 - Amateur Radio Advanced and Technical Questions

Table of Contents
-----------------
Dates indicate last modification.

Part 1 - Introduction to the FAQ and Amateur Radio
** Table of Contents (1/93)
** Introduction to the FAQ (11/92)
* How to Contribute to the FAQ Articles (1/93)
* Acknowledgements (7/92)
* Notes on "Netiquette" (1/93)
```

** What is Amateur Radio? (11/92)
** Who can become a ham in the United States? (11/92)
** Where can I locate information and books on Amateur Radio? (4/92)
** How much does it cost? (4/92)
** Where can I take the tests? (pre-4/92)
** What are the tests like? (4/92)
** What can I do with a ham radio license? (5/92)
** What can't I do with an Amateur Radio license? (pre-4/92)
** I'm interested, who will help me? (11/92)
** Should I build my own equipment or antenna? (11/92)

Part 2 - Amateur Radio Organizations, Services, and Information Sources
** Where can I find Ham Radio information with a computer? (11/92)
* The rec.radio.* newsgroups (new 1/93)
* The ARRL e-mail server (1/93)
* The Internet File Transfer Protocol (FTP) (1/93)
* Access to FTP archives via electronic mail (1/93)
* The Info-Hams mail list: rec.radio.amateur.misc by mail (1/93)
* Telephone BBS's with Ham-related information (11/92)
* Callsign servers and geographical name servers (11/92)
* FTP access to FCC Part 97 and FCC Amateur Radio question pools (11/92)
* Lists of radio modifications and extensions (11/92)
** Can I send ARRL or W5YI electronic mail? (11/92)
** "Why doesn't the ARRL do...?" (11/92)
** What magazines are available for Ham Radio? (pre-4/92)
** How do I use the incoming and outgoing QSL bureau? (11/92)
** Are there any news groups for CAP? (11/92)
** What's the name of the QRP club that issues QRP numbers? (pre-4/92)
** How do I become a 10-10 member? (pre-4/92)
** How do I join MARS? (1/93)
** How do I join RACES? (pre-4/92)
** What organizations are available to help handicapped hams? (pre-4/92)
** I am looking for a specific ham, can anyone help me find him? (pre-4/92)
** Can I post my neat new ham related program on rec.radio.amateur.misc?
(pre-4/92)
** Where can I get ham radio software for my computer? (4/92)
** Are there Dialup News services or BBSs for Amateur Radio? (4/92)
** Where can I find VE sessions in my local area? (6/92)
** Why isn't XXX available electronically? (4/92)

Part 3 - Amateur Radio Advanced and Technical Questions
** What are the different US amateur classes and what can each of them do?
(pre-4/92)
** What is the best way to learn Morse Code? (10/92)
** What is the standard for measuring Morse code speed? (pre-4/92)
** I'm confused. What do all those abbreviations mean??? (5/92)
** What do all those "tones" mean? (pre-4/92)
** Where can I learn more about Amateur Radio if I live outside the US?
(4/92)
** How can I get a "reciprocal license" if I am a licensed ham from another
country or if I am a FCC licensed ham who wants to operate in another

country (on vacation)? (11/92)
** My apartment or housing complex does not allow outdoor antennas, now what
do I do? (pre-4/92)
** I got TVI...HELP!!! (pre-4/92)
** Did you know that you can get college credit for being a ham? (pre-4/92)
** On what frequencies do JPL and GSFC retransmit the shuttle audio?
(10/92)
** Can I take my HT on an airplane and operate it if I get the permission
of the captain? (4/92)
** How do I modify my current Amateur license? (4/92)
** I'm confused about XXX, should I ask the FCC? (4/92)
** Is there any information on antique radios? (pre-4/92)
** Where can I buy vacuum tubes? (pre-4/92)
** What do I need to get started in packet radio? (5/92)
** What do I need to get started in satellite communications? (pre-4/92)
** What is available to get started in ATV, SSTV and WEFAX? (5/92)
** What are these contests I sometimes hear, and how do I participate? (7/92)

--Rec.radio.amateur.misc Frequently-asked Questions------------------Part 1--

** Introduction to the FAQ

* How to Contribute to the FAQ Articles

We accept suggestions from the Amateur Radio community. Please
consider the following criteria:
- is it a commonly asked question?
- will its inclusion help reduce the usage of network bandwidth?
- how useful is it to beginning Hams or to the majority of Hams?
Contributions don't have to meet all of these but the minimum is one.
We actually only ask that you consider these before contributing.

We can't necessarily include every question or every topic - the
network simply doesn't have enough bandwidth to carry that much
information. Besides, the point is that we're trying to conserve
network bandwidth. You can find the locations of much more informa-
tion by referring to the "Index to the rec.radio.amateur.* Supple-
mental Archives" posted monthly by Paul Schleck KD3FU.

If you suggest a question for this FAQ, please include the answer.
You'll get credit for your contribution and you'll speed up the pro-
cess of getting the information ready for distribution.

If you feel your contribution is sufficient to meet the considerations
shown above, send it to hamradio-faq@amdahl.com so that it will
reach all the FAQ coordinators: (listed in alphabetical order)

Diana L Carlson KC1SP dls@genrad.com (Hudson, NH, USA)
Ed Hare KA1CV ehare@arrl.org (Newington, CT, USA)
Ian Kluft (editor) KD6EUI ikluft@uts.amdahl.com (San Jose, CA, USA)
Michael Larish KD6CTZ nomad@ecst.csuchico.edu (Chico, CA, USA)
Paul Schleck KD3FU pschleck@unomaha.edu (Omaha, NE, USA)
Chris Swartout N6WCP cas30@uts.amdahl.com (San Jose, CA, USA)

Rosalie White WA1STO rwhite@arrl.org (Newington, CT, USA)
Derek Wills AA5BT oo7@astro.as.utexas.edu (Austin, TX, USA)

* Acknowledgements

All questions listed as modified "pre-4/92" are entirely Diana Carlson's work or her editing of a contributor's work. Diana established this FAQ. She is now one of the larger group that maintains it but we didn't want her effort to be lost in the crowd.

* Notes on "Netiquette"

The rec.radio.amateur.misc newsgroup and Info-Hams mail list have a large daily volume of traffic. They can operate more efficiently if the following netiquette guidelines are followed. Please take them seriously.
* If you are new to UseNet, the introductory articles in news.announce.newusers are required reading. Go to that newsgroup now.
* When posting a followup article, ALWAYS try to minimize the number of lines of quoted material from the original article.
* As a general rule when you try to determine whether to reply to someone by e-mail or with a followup article, remember to "praise in public, criticize in private." It's OK to disagree technically but be careful not to attack the person with whom you disagree. Also, be careful with your use of the word "you" when posting a follow-up article. Many unnecessary flame wars have started that way.
* Use a descriptive subject. For example, a message subject of "Ham Radio" tells the reader NOTHING about the contents of your article since the whole newsgroup is about Ham Radio. Other examples of subjects which are so broad that they become useless could include, "Help," "A Question," "Antennas," or "Frequencies." Maybe "Books on Antennas?" or "Where can I find Repeater Frequencies?" would be better, for example. Remember, in a busy newsgroup a lot of users decide which articles to read from the subject line alone. If you post, don't deprive yourself of an audience!
* Before answering a question, check if the FAQ adequately answers it or if someone else already answered it. If you have more to add, make sure to reference either the FAQ or the related articles.
* If a user posts a question which is directly answered by the FAQ, there is no need to post an answer - the information is already available on the newsgroup. Instead, just send an e-mail message which politely explains where to find the FAQ. They will probably appreciate it if you include the answer to their question. (Don't send a "nastygram" - that would just discourage future participation.)
* Pay attention to the size of your audience - use the "Distribution:" header. If you leave it blank, your message will go to every civilized country in the world and occupy disk space in all news systems in all those places. If that's what you intend, that's fine but make sure your article is relevant outside your country. (In

particular, Hams should already know there is more to the world than just their own country.)
* If you have an item for sale, please limit the distribution area so that, for example, an article about a radio for sale in New Jersey won't get to California or Europe. If you wish, you may cross-post your for-sale article to rec.radio.swap.
* Software sources should be posted to either alt.sources, comp.sources.misc, or comp.sources.* for a specific machine type. Software binaries should be posted to the appropriate subgroup of comp.binaries.

** What is Amateur Radio?
Amateur Radio is a non-commercial radio communication service whose primary aims are public service, technical training and experimentation, and communication between private persons. Amateur Radio operators are commonly called hams. Hams often communicate with each other recreationally but also provide communications for others at public events or in times of emergency or disaster.

** Who can become a ham in the United States?
Anyone who is not a representative of a foreign government can be an Amateur Radio operator in the USA. There are tests that you must pass to get a license, however the tests are not insurmountable.

** Where can I locate information and books on Amateur Radio?
Your local Radio Shack sells some ham radios and Amateur Radio license books. Books can also be obtained through the mail from ham radio organizations, such as ARRL in Newington, CT (203-666-1541) and W5YI in Dallas, TX (1-800-669-9594). There may be one or two ham radio stores in the local area (ie, within 50 miles). Try looking in the Yellow Pages under Radio Communications.

For the Novice license, get a Novice License manual, plus 5-word-per-minute Morse code tapes, costing around $25. For the Technician license, get a combined Novice and Technician License manual, and an FCC Rules manual, costing around $32. The FCC Rules manual is a good idea for Novice also, but not necessary, since the Novice License manual contains all the FCC Rules that are required for the Novice License.

The ARRL Education Activities Department has several programs to help amateurs (or prospective amateurs) to get started. Ask for a "New prospect package" available free of charge, from ARRL HQ, Educational Activities Department, 225 Main St, Newington, CT 06111.

** How much does it cost?
To take the Novice tests, it's free. To take the Technician or higher class tests, there is a small charge (around $5-$6 currently) to cover copying costs and running the testing sessions. The cost of a radio is really dependent on what you want to do. You can make your own radio and antenna for under $150. You can buy a used

single-band radio for $150-$300. Or you can buy a new multi-band multi-mode radio with all the doodads for $300-$3000. I'd suggest you learn more about ham radio, talk to local hams, find out what you want to do with ham radio first.

** Where can I take the tests?
The Novice tests can be given by any two qualified hams of General class license or above. The Technician tests and all higher class license tests are given by three qualified Volunteer Examiners (VEs) who volunteer their time.

To locate an ARRL testing session in your area, you can contact ARRL at 203-666-1541 x282.

** What are the tests like?
First off, come prepared to VE sessions. Bring: TWO forms of ID, one of which has a picture on it; a calculator (if necessary); a pen and two pencils; the applicable examination fee (around $5-$6 for 1992); the original AND a copy of your current Amateur Radio license (if you have one); the original AND a copy of any CSCEs for tests you've already passed (if you have any).

Each of the written tests (Novice, Technician, General, Advanced, and Extra) are generally a multiple choice test of approximately one-tenth of the question pool. For example, if the question pool is approximately 300 questions, then the test will be a 30-question test. You need to get 75% correct to pass. Note that they truncate to determine the correct number of questions. That means for a 30 question test, you need to get 22 right, which is actually only 73.3%.

Once you've paid the small fee for Technician-Extra tests, it costs no extra to take another test, so I'd suggest you keep taking the next more advanced test until you fail. If you pass the written but not the Morse code (or vice versa) for a specific class license, you have up to one year to take the other test before you would have to retake the written test again. Note that some VEs will not allow you to take the written test unless you've first taken the Morse code test.

The Morse code test is a receiving test only. The test run 5 to 7 minutes. After the test, you are given a 10-question multiple-choice or fill-in-the-blank test. Passing grade is 7 or more. If you fail the 10-question test, the examiner team will examine your copy sheet to see if you have 1 minute of solid copy with no errors. For 5 wpm, that's 25 characters, for 13 wpm, that's 65 characters, for 20 wpm, that's 100 characters. If they can find 1 minute solid copy, you've still passed.

Hints on Morse code tests: Generally, it will be a standard QSO (conversation), and it MUST contain at least one of each of the following:
26 letters A-Z, 10 numbers 0-9, comma (,), period (.), slant or

slash (/), question mark (?), double dash prosign (BT), end of message prosign (AR), end of contact prosign (SK).
The letters count as one character, all others count as two characters. There are a couple other prosigns which are worth knowing, but will not be on the test, like "I'm done talking, next" is K, "I'm done talking, back to you" is KN, "Please wait" is AS.

** What can I do with a ham radio license?
There are so many things, it's a difficult question to answer, but here's some ideas:
* Talk to people in foreign countries.
* Talk to people (both local and far away) on your drive to work.
* Help in emergencies by providing communications.
* Provide communications in parades or walkathons.
* Help other people become hams.
* Hook your computer to your radio and communicate by computers.
* Collect QSL cards (cards from other hams) from all over the United States and foreign countries and receive awards.
* Participate in contests or Field Day events.
* Provide radio services to your local Civil Defense organization thru ARES (Amateur Radio Emergency Service) or RACES (Radio Amateur Civil Emergency Service).
* Aid members of the US military by joining MARS (Military Affiliate Radio System).
* Participate in transmitter hunt games and maybe build your own direction-finding equipment.
* Have someone to talk to on those sleepless nights at home.
* Receive weather pictures via satellites.
* Build radios, antennas, learn some electronics and radio theory.
* Talk to astronauts in space, or use the moon to bounce signals back to people on the Earth.
* Experiment with Amateur TV (ATV), Slow-Scan TV (SSTV), or send still-frame pictures by facsimile.
* Experiment with amateur satellite communications.

** What can't I do with an Amateur Radio license?
The most important thing you can't do is transact business of any kind over ham radio. Interference to other hams or services, as well as obscene, profane or indecent language is not tolerated and is illegal. Music and broadcasting are not allowed on ham radio. Some personal conversations may not be appropriate to Amateur Radio. Do you really want the whole world to hear about Aunt Mabel's hemorrhoids?

** I'm interested, who will help me?
There are hams who are willing to become "Elmers" (mentors, helpers) in your local area. Look around and ask local hams. Search out local radio clubs. As well, some people have volunteered to be an Elmer over the Usenet. A list of UseNet Elmers and their e-mail addresses is posted to the newsgroup monthly. If anyone wants to be an Elmer, send e-mail to

elmers-request@unomaha.edu

** Should I build my own equipment or antenna?
"Homebrewing" is a fun and educational part of ham radio. It is a thrill to build your own transmitter and put it on the air. However, building your own receiver can be quite complicated; if you don't have electronics experience, you may want to buy a receiver instead. Most homebrew transmitters are QRP (transmit very low power). That's fine for an experienced ham with a very good antenna, but a Novice ham will just get frustrated. Your first rig, therefore should NOT be a home-brew.

Antennas can be much simpler projects than the transceiver, though some types are also quite involved. Most hams build their own antennas for base station use and buy antennas for mobile (car) use. Most beginner ham books describe how to build different types of antennas. Order of difficulty, from easiest to more difficult, for some common antennas are: wire dipole, Zepp, Yagi, Quad, and Log-Periodic. Books from many sources, including ARRL and several Hams, discuss antennas in depth.

When building or even understanding antennas, it is good to know the relationship between the antenna element length and the frequency or wavelength it is designed for. An antenna performs best at multiples of 1/4 of that wavelength, though 5/8 wave also has beneficial qualities. The wavelength is related to the frequency with the following formula:

wavelength (in meters) = 300 / frequency (in megahertz)

You do not need a huge antenna or tower like ones you may see around your neighborhood. Large beam antennas and 40-foot towers are very expensive. As a beginner, a simple dipole antenna is perfectly adequate. As you gain experience (and money :-), you may want to invest in something bigger.

If you can afford new rigs and antennas, there are many mail order stores that advertise in ham radio magazines. If you want to buy a used rig, the best place is at a "hamfest" (ham flea market). You should take along an experienced ham, since some of the used equipment may be inoperative, overpriced or poor quality. You can also answer ads in ham magazines or posted at ham radio stores, although often, by the time you call, the equipment has already been sold.

2135. rec.radio.amateur.misc Frequently Asked Questions (Part 2 of 3)

Newsgroup: rec.radio.amateur.misc
Date: 1993-05-07 09:43:09 UTC
From: ikluft@uts.amdahl.com
Message-ID: <ham-radio-faq-2-736767782@uts.amdahl.com>

Revision: 3.9 04/26/93 22:05:23

Rec.radio.amateur.misc Frequently Asked Questions
Part 2 - Amateur Radio Organizations, Services, and Information Sources
------------------------------------------------------------------------------

Questions discussed in Part 2: (dates indicate last modification)
** Where can I find Ham Radio information with a computer? (11/92)
* The rec.radio.* newsgroups (new 1/93)
* The ARRL e-mail server (1/93)
* The Internet File Transfer Protocol (FTP) (1/93)
* Access to FTP archives via electronic mail (1/93)
* The Info-Hams mail list: rec.radio.amateur.misc by mail (1/93)
* Telephone BBS's with Ham-related information (11/92)
* Callsign servers and geographical name servers (11/92)
* FTP access to FCC Part 97 and FCC Amateur Radio question pools (11/92)
* Lists of radio modifications and extensions (11/92)
** Can I send ARRL or W5YI electronic mail? (11/92)
** "Why doesn't the ARRL do...?" (11/92)
** What magazines are available for Ham Radio? (pre-4/92)
** How do I use the incoming and outgoing QSL bureau? (11/92)
** Are there any news groups for CAP? (11/92)
** What's the name of the QRP club that issues QRP numbers? (pre-4/92)
** How do I become a 10-10 member? (pre-4/92)
** How do I join MARS? (1/93)
** How do I join RACES? (pre-4/92)
** What organizations are available to help handicapped hams? (pre-4/92)
** I am looking for a specific ham, can anyone help me find him? (pre-4/92)
** Can I post my neat new ham related program on rec.radio.amateur.misc?
(pre-4/92)
** Where can I get ham radio software for my computer? (4/92)
** Are there Dialup News services or BBSs for Amateur Radio? (4/92)
** Where can I find VE sessions in my local area? (6/92)
** Why isn't XXX available electronically? (4/92)

--Rec.radio.amateur.misc Frequently-asked Questions------------------Part 2--

** Where can I find Ham Radio information with a computer?
This question has many answers spanning several electronic media
including UseNet, electronic mail, the Internet, dialup bulletin board
systems (BBS) and others. Various electronic information sources are
summarized under the subheadings that follow.
```

All electronic mail addresses listed are in Internet format. If your site is not connected to the Internet and does not support Internet-style mail addresses, you will need to contact either your system administrators or a local "guru" to find out how or if you can send mail to the sites listed. Ask them, "how can I get mail to the Internet?" and show them the address you're interested in.

* The rec.radio.* newsgroups
The primary distribution mechanism for this FAQ is UseNet. There are several newsgroups dealing with Amateur Radio and other aspects of radio. The full list is as follows:

rec.radio.amateur.misc (*) Ham Radio - misc/general topics
rec.radio.amateur.packet Ham Radio - computer/packet radio
rec.radio.amateur.policy Ham Radio - policy & regulation
rec.radio.broadcasting public broadcast radio
rec.radio.cb Citizens' Band Radio
rec.radio.info (*) periodic info from all rec.radio groups
rec.radio.noncomm misc non-commercial radio topics
rec.radio.shortwave Shortwave Radio
rec.radio.swap radio equipment wanted and for sale

This FAQ is cross-posted to the newsgroups marked with asterisks (*). It is also cross-posted to rec.answers (the archive for FAQs in the rec.* newsgroups) and to news.answers (UseNet's general repository for FAQs.) These should be the first places to look for new current copies of the FAQ.

Most of the rec.radio newsgroups have their own FAQs as well.

* The ARRL e-mail server
ARRL is the American Radio Relay League, representing and promoting Amateur Radio in the USA. They have established an automated file server which responds to information requests via electronic mail. To use the server, send mail to info@arrl.org with any number of one-line commands in your message. Valid commands are as follows:

help sends more detailed instructions about the e-mail server
index sends a list of the files currently available
send file sends a file (replace "file" with the file's name)
several files are referenced by name in parts of this FAQ
quit ends command processing - use it if a signature will be appended to your message

The server program will respond to the commands, each in a separate message. Among many other informative files, a current copy of the FAQ (updated monthly) can be obtained from the ARRL e-mail server.

* The Internet File Transfer Protocol (FTP)
Sites connected to the Internet can access large amounts of data almost anywhere in the world, often at high speeds. One common way to transfer the data you want is FTP. Some sites offer a service called "anonymous FTP" which allows remote users to access a set of public files without requiring a password.

Tom Czarnik coordinates a fairly definitive list of anonymous FTP sites, their IP numbers, time zones, general contents, and access policies which he posts to the comp.misc, comp.sources.wanted, alt.sources.wanted, and news.answers newsgroups. It is itself available via anonymous FTP (how about that?? :-) from (among other places) rtfm.mit.edu (18.172.1.27) under directory /pub/usenet/news.answers/ftp-list.

For specific information about exact locations of files by name, the Archie database server may be of help. First check if anyone has installed the "archie" program on your machine and use it. Archie may also be accessed by telnetting to one of the following sites (use the one closest to you):

Finland/Europe: archie.funet.fi (128.215.6.100)
Canada: archie.mcgill.ca (132.206.2.3)
Australia/New Zealand: archie.au (128.184.1.4)
Israel: cs.huji.ac.il (132.65.6.5)
UK/Ireland: raquel.doc.ic.ac.uk (146.169.11.3)
USA (Maryland): archie.sura.net (128.167.254.179)
USA (Nebraska): archie.unl.edu (129.93.1.14)
USA (New York): archie.ans.net (147.225.1.2)
USA (New Jersey): archie.rutgers.edu (128.6.18.15)

Login is archie. Type "help" at the prompt for a description of all server commands.

For those without telnet capability, the database may be accessed non-interactively via mail server. Send E-mail with the word "help" to archie@host where host is one of the Archie sites above.

The above two resources (the FTP list and the Archie server) are extremely powerful tools for finding out "what's out there" at various FTP sites around the world. *PLEASE* exhaust their capabilities before posting requests to the net.

The following is a brief summary of major ham-related FTP sites and places where you can obtain a current copy of this FAQ:

ftp.cs.buffalo.edu (128.205.32.9)
(submissions to this ftp site should be made to bowen@cs.buffalo.edu) - contains many ham radio files, including the FAQs, Elmer list, SWL and scanner info, Packet FAQ, examination opportunities, information on various regulations, information on commercial radios (i.e. GE or Motorola), SSTV (slow-scan TV), HTs (handheld transceivers) and the KA2UGQ worldwide BBS list. See ~pub/ham-radio. This FAQ is updated monthly here.
grivel.une.edu.au (129.180.4.7)
This site contains a mirror of ftp.cs.buffalo.edu's Ham Radio archives. It provides a shorter distance if you're in Australia or if Australia is a shorter net.path for you than New York.

wsmr-simtel20.army.mil (192.88.110.20)
Keith Peterson, W8SDZ, has apparently returned as the
maintainer of this huge repository of ham-radio (software and
modifications), MS-DOS, and CP/M files. To find out how
to submit files to this archive, please read his informational
posts to the comp.binaries.ibm.pc.archives newsgroup. If you
cannot directly FTP from wsmr-simtel20, there is a mail server
that can help. Send mail with the text "help" to
listserv@vm.ecs.rpi.edu (128.113.5.11).
wuarchive.wustl.edu (128.252.135.4)
A "mirror" of the files available on Simtel20, plus a *LOT*
more. A more user-friendly Unix environment (plus a faster
net connection) makes this site preferred over Simtel20.
If you are on a Unix box locally, see if your system
administrator will "NFS-mount" these files for faster/easier
access.
ucsd.edu (128.54.16.1)
The "home" site (with the most recent versions for the largest
number of different computer platforms) of the KA9Q TCP/IP
Network Operating System (NOS), other ham-related software,
and the archives for the Info-Hams, Packet-Radio, Ham-Policy,
Radio-Info and TCP-Group digests.
uxc.cso.uiuc.edu (128.174.5.50)
cd pub/ham-radio - This site contains the HyperCard Hamstacks
written by Diana Syriac as well as ASCII readable ham radio
question pools.
ftp.apple.com (130.43.2.3)
cd pub/ham-radio - Ham software and information, especially
Macintosh software
ftp.uu.net (137.39.1.9)
wuarchive.wustl.edu (128.252.135.4)
wolfen.cc.uow.edu.au (130.130.68.4)
athene.uni-paderborn.de (131.234.2.32)
nic.funet.fi (128.214.6.100)
ham radio files and software for the Amiga computer system
rtfm.mit.edu (18.70.0.226) also called pit-manager.mit.edu
cd pub/usenet/news.answers - all participating FAQs and
periodic informational postings are archived here, including
those from the rec.radio.* newsgroups which can be found in
pub/usenet/news.answers/radio. Participating FAQs are
automatically archived here when they are posted on UseNet.
uts.mcc.ac.uk (130.88.200.3)
cd gopher-data/justforfun/faq/recreation - see *radio* for
radio-related FAQs. This site is located in the UK and is
a good place to obtain the FAQ from the UK and the European
mainland.
ftp.amdahl.com (129.212.11.1) also called charon.amdahl.com
cd pub/radio/amateur - the most up-to-date copy of the FAQ
(updated nightly when changes are made)

If you experience difficulty connecting to the above FTP sites, some troubleshooting hints are shown below. The unfortunate situation here is that Netnews is far more prevalent than direct Internet hookups, accurate name servers, smart mailers and routers, and of course, telnet and FTP client services. What this means is that your trouble may be caused by MANY factors.

Here's some hints to check what's wrong:
* It may very well be that your newsfeed and email are via dialup line and UUCP (Unix-to-Unix copy) in the wee hours of the morning. If this is the case, then you have no direct connection to the Internet and thus cannot use real-time interactive services like FTP and telnet.
* If you are at a college or university, your host (ie, the computer you are logged onto) may be on the Bitnet network, which has an email gateway to the Internet, but no direct connect capability.
* If you do have a direct connection to the Internet, does your host have telnet and/or FTP client programs? (ie, if you type "ftp" or "telnet" at your command prompt, do you get anything?) Many hosts, particularly IBM mainframes not running Unix, do not support these services!
* Can you telnet to other hosts and get a login prompt?
It may very well be that some hosts are "not recognized" due to misconfigured connections and inaccurate host tables/name servers (*.mil computers are *NOTORIOUS* for this!)
* If you get "host not in host table" or "host unknown" or similar error, try telnetting via the IP number, a set of four 1-3-digit numbers separated by periods (eg, 137.48.1.1). The exact IP number for the site can be obtained via the nslookup utility, if your computer supports it....or check the FAQs. Your host may not recognize the "fully-qualified domain name" (like callsign.cs.buffalo.edu), but it should ALWAYS recognize an IP number if their network is reachable from yours.
* If you get "network unreachable" check with some more knowledgeable users if your site is actually connected to the Internet. If it is, a link in the network may be temporarily disconnected for maintenance (or by accident.)
* In the case of telnetting to a non-default port (as in the case with the callbook servers), if telnet <host> <port#> doesn't work, but you can telnet to the default login port (ie, no qualifiers), then the manner at which the port qualifier is entered may be system dependent.
* Syntax for telnetting from different operating systems differ.
Some common command syntaxes are: (angle brackets are for readability, do not type these in literally)
Berkeley Unix or VMS with Wollongong TCP/IP uses syntax:
telnet <host> <socket#>
Other possibilities to try:
telnet console <host> (for 2000 port)
telnet <CR> open <host>:<port#>
telnet <host>/<port#>

telnet <host>/port=<port#> (for Multinet on VMS)
* Compression techniques are different for different operating systems.
However, these hints should help: foo.sit needs MacIntosh UnStuffit
to unstuff; foo.hqx needs MacIntosh BinHex to uncompress; foo.Z
needs Unix 'uncompress' to uncompress or VMX compress_vms.exe (on
gatekeeper.dec.com) will work too. If more than one method was used,
like for foo.hqx.Z, start at the outside and work in (so uncompress
on Unix with 'uncompress' first, transfer to MacIntosh, then
uncompress with BinHex to get uncompressed file).
* There is an excellent introduction to FTP and archiving software
regularly posted to comp.binaries.ibm.pc and news.answers.
* If all else fails, ASK your system administrator or check system
documentation.

* Access to FTP archives via electronic mail
ANY BITNET, EARN, or NorthNET site can access the Princeton mail
server. It will be most efficient if you know the complete path
and filename for anything you wish to transfer, but you can use
'cd' and 'ls -l' commands to move about and browse the remote site's
directories. The Archie database server may also be useful to search
for files and their directory locations on FTP sites around the world
(see below). Please be patient when using non-interactive mail
servers such as BITFTP as each request may take several hours (or
longer) to be fulfilled.

For access to the FTP server, send email to bitftp@pucc.bitnet (for
BITNET, EARN and NorthNET users ONLY!). Subject doesn't matter.
The text of the email is the FTP commands one after another. For
example, suppose you wanted to access the FTP site lcs.mit.edu:
FTP lcs.mit.edu
USER anonymous
PASS yourname@yoursite (not required)
ASCII
CD telecom-archives
GET filenames
BYE
A help file is available giving detailed instructions by putting
the single word HELP into the text of the email.

For nonBITNET users, there is also a FTPMAIL server at
ftpmail@decwrl.dec.com (16.1.0.1). Commands include: REPLY
<mailaddr>, CONNECT [HOST [user [pass]]], ASCII, BINARY, COMPRESS,
COMPACT, UUENCODE, BTOA, LS <directory>, DIR <directory>, GET <file>,
QUIT, HELP. Get the help file for more information by sending mail
with the single line "help". The ftpmail site may complain if you try
try to get more than 1 file per email request. Here is an example of
a request:
reply your_name@your_site
connect uxc.cso.uiuc.edu
binary
uuencode

get pub/ham-radio/Tech.v3.3.sit.hqx.Z
quit

A note on the use of FTP mailservers: If you want to use FTP mailservers, like FTPMAIL, please be considerate of any systems that your mail must pass through. The quickest way to find yourself cut off from the world is to make the admins of sites that pass your mail pass 60Mb of X11 graphics system source. If you need large amounts of information from a mailserver, contact your admin for help -- it may already be available, or he may know a better way to get it.

* The Info-Hams mail list: rec.radio.amateur.misc by mail
You can use rec.radio.amateur.misc even if your site has no NetNews feed. To subscribe to rec.radio.amateur.misc, send email to:
Info-Hams-Request@ucsd.edu
In the body of the message, write:
subscribe Info-Hams
If your local e-mail software does not provide a valid return address (i.e. Bitnet, many Milnet sites, and many non-Unix e-mail packages) you can provide your return address between the "subscribe" and the name of the mailing list (i.e. "subscribe myname@here.org Info-Hams".)

Similarly, to subscribe to some other rec.radio.* newsgroups, use the following directions:
* To subscribe to rec.radio.amateur.packet, send email to Packet-Radio-Request@ucsd.edu, message is "subscribe Packet-Radio"
* To subscribe to rec.radio.amateur.policy, send email to Ham-Policy-Request@ucsd.edu, message is "subscribe Ham-Policy"
* To subscribe to rec.radio.info, send email to Radio-Info-Request@ucsd.edu, message is "subscribe Radio-Info"
* To subscribe to rec.radio.shortwave, send email to listserv@cuvma.columbia.edu, message is "subscribe swl-l (your name)"

TO UNSUBSCRIBE, follow directions above, changing the command word "subscribe" to "unsubscribe"
DON'T POST TO THE NEWSGROUP ITSELF! USE THE REQUEST ADDRESS!
Help is available by using the command word "help". Note that command words MUST be the first word on each line of the message.

You can post to rec.radio.amateur.{misc,packet,policy} by sending your posting email to Info-Hams, Packet-Radio, or Ham-Policy, all at ucsd.edu. Since rec.radio.info is a moderated newsgroup, requests to post to it may be sent to Radio-Info but they will be mailed to the moderator, rec-radio-info@ve6mgs.ampr.ab.ca, for posting.

All of the Amateur radio newsgroups are archived for FTP on ucsd.edu under subdirectory mailarchives/{Ham-Policy, Info-Hams,Packet-Radio}. Radio-Info is not archived at UCSD. (See the news.answers archives at rtfm.mit.edu.)

* Telephone BBS's with Ham-related information
WB3FFV has one, phones are 301-625-0817 or 301-625-9482 or

301-625-9663. Data settings are 8 bits, NO parity, 1 stop bit.
Login is bbs, no password.
This BBS is also available via UUCP, login is uucpanon, no password.
For a listing of available archived, try:
uucp wb3ffv!~/FILES /usr/spool/uucppublic

Another one is N8EMR at phone 614-895-2553, login hbbs. Data settings are 8 bits, NO parity, 1 stop bit. N8EMR has a comprehensive list of other ham-related BBS's on-line.

* Callsign servers and geographical name servers
If you are at an Internet site you can connect using telnet to one of the two primary servers:

callsign.cs.buffalo.edu (currently 128.205.32.2)
ham.njit.edu (currently 128.235.1.10)

There is also a general geographical name server at:

martini.eecs.umich.edu (currently 141.212.100.9)

The callbook servers sit on port number 2000 and the geographical name server sits on port 3000. These are different port numbers than what telnet usually defaults to. So if you just telnet to these machines, you will get a login prompt instead of the server. How you tell your telnet program to connect to port 2000 or 3000 instead of the default port is operating system dependent but it is usually done with a line like

telnet callsign.cs.Buffalo.EDU 2000

If this doesn't work, check the telnet/FTP troubleshooting hints above or consult your local systems guru for the proper command string.

The interactive servers are designed to be somewhat self-explanatory and they support fairly detailed help facilities. The first command you should execute when connecting to one of these servers is "info". This will list general info about that server and how to use it. You should then type "help" to list the various commands available. Typing "help" followed by a command name will give you a little more detail about that command. Servers allow searches by call, last name, zip code or city and also provide regular expression filters to trim your searches so you get a reasonable amount of output.

Both these servers are built from a database distributed by Rusty Carruth, N7IKQ. This database currently contains US and Canadian callsigns and it does not contain club calls. A new version of the database is sent around approximately once a year.

There is also an email callsign server at callbook@sat.datapoint.com (The UUCP address is ...!uunet!dptspd!callbook). In the body of the text, say "lookup" followed by callsigns you want to look up. If your mailer appends signature files, you should put a line "quit" at the end of your request (before the signature file). If you want

help, put the word "help" on a line by itself. Here is what a
request might look like:
help
lookup kc1sp wn4bbj
lookup n0fzd
quit

There is another email callsign server at callbook@n8emr.cmhnet.org.
The subject line is the list of callsigns to lookup. All other lines
are ignored. This same callsign server can be accessed with packet
radio via cbook@n8jyv.#cmh.oh.usa.na. The body of the message should
include "REPLY n8jyv!HOME_BBS!CALL" (where HOME_BBS is YOUR home BBS,
and CALL is YOUR callsign), carriage return, "CALL call1 call2 ..."
(where call1 call2 .... is space separated list of callsigns you want
to lookup).

If you are a packet radio station, callserver data is available from
REQQTH@WA4ONG.VA.USA.NA, subject line should be up to 5 US callsigns,
separated by spaces. For Canadian calls, use the callserver at
REQQTH@VE3JF.ON.CAN. Body of message is ignored. The server is an
OS interface to the MBL packet BBS using the Buckmaster CD-ROM
callsign database.

The REQQTH address is for the AX.25 radio-linked amateur packet
network, *NOT* the Internet. If you attempt to send Internet mail to
this address, and use the old .NA suffix instead of the new .NOAM
suffix, it will get routed to Nimibia (Internet suffix .na) which is
currently paying a lot of money for misdirected ham mail. Help
maintain a positive example for amateur radio and please do not
attempt this!

The FCC "call sign hotline" at 717-337-1212 is available for those
who wish to listen to the call signs allocated in each group for each
district. This requires only a touch-tone telephone to use.

* FTP access to FCC Part 97 and FCC Amateur Radio question pools
Part 97 is part of the FCC regulations and only applies to the USA.

The text to part 97 is available by ftp from several locations:
Western US
ftp.amdahl.com /pub/radio/amateur/part97.txt.Z
Central US
pacific.mps.ohio-state.edu /msdos/ham/part97.arc
Eastern US
gandalf.umcs.maine.edu /pub/ham-radio/part97.txt
ftp.uu.net /networking/ka9q/part97.arc
The *.arc files are MSDOS ARC files with the same ASCII text.

An ASCII copy of the question pools are available by ftp from
uxc.cso.uiuc.edu (128.174.5.50) in /pub/ham-radio/<class>-pool.txt.Z,
where <class> is novice, technician, general, advanced or extra.

* Lists of radio modifications and extensions
Some mods can be found on wsmr-simtel20.army.mil or
the Simtel20 mirror directories on wuarchive.wustl.edu.

There is a new server at pcserver@novell.business.uwo.ca. Some
examples of main body email requests are as follows:
HELP
SENDME RADIO MODS
SENDME TH215 MODS
SENDME ALLBAND MODS

There is a packet radio Mods Server. To get the directories, send
a packet as follows:
SP REQFIL@N2IMC.NJ.USA.NA
Subject: MODS\Dir.1
/EX
To get the mod, send to same place, with Subject MODS\Filename.ext.

REMEMBER that any modification is likely to void your warranty and
that these mods are NOT guaranteed to work. This list is supplied
here because it is sometimes a frequent question on the newsgroup.

** Can I send ARRL or W5YI electronic mail?
Several ARRL HQ staffers can be contacted via the net. Their e-mail
addresses are available from the ARRL e-mail file server in the
file called "email". See above for more information on the ARRL
e-mail server.

ARRL requests that you include your postal address (the slow kind) in
case they need to send you nonelectronic material in answer to your
request.

W5YI, a large VEC, can be reached at the following address:
Fred Maia, W5YI 3511297@mcimail.com

** "Why doesn't the ARRL do...?"
If you want the ARRL to do something, tell them! Direct input from a
concerned member (or, actually, any concerned Ham) carries a lot more
weight than hearsay from any source. Their e-mail addresses are
available from the ARRL e-mail file server (see above). They want
direct input - that's why those addresses are available.

** What magazines are available for Ham Radio?
Your local ham store may have some, but here's some popular ones
(this is NOT a complete list!):
QST, ARRL, 225 Main St, Newington, CT 06111 - basic projects and
contesting
CQ The Radio Amateur's Journal, 76 North Broadway, Hicksville, NY
11801 - beginner ham radio articles
73 Amateur Radio Today, WGE Center, Forect Rd, Hancock, NH 03449,
FAX (603) 525-4423, email: COMPUSERVE 70310,775 or Internet
70310.775@compuserve.com - more technical ham radio articles
QEX, ARRL, 225 Main St, Newington, CT 06111 - more technical projects
WorldRadio, 2120 28th St, Sacramento, CA 95818, (916) 457-3655.

Subscriptions to 201 Lathrop Way, Ste D, Sacramento, CA 95815,
(800) 365-SUBS - lots of special interest columns, like QRP,
ATV, YL, etc.
W5YI Report, PO Box 565101, Dallas, TX 75356, 1-800-669-9594 -
up-to-date information on Amateur Radio happenings, including
VE information and statistics

** How do I use the incoming and outgoing QSL bureau?
To use the outgoing QSL bureau, you must be a member of ARRL. In
general, you send a bundle of foreign (not States!) QSL cards to
the outgoing bureau in Newington, Connecticut, along with a label
off of your QST magazine (which shows ARRL membership), along with
$2 per pound of cards (approximately 150 cards) or $1 for 10 cards
or less.

To use the incoming QSL bureau, you do NOT have to be a member of
ARRL. Send one or more Self-Addressed Stamped Envelopes (size 5x7
or 6x9, NO BIGGER, NO SMALLER) with one ounce of postage attached
and with your callsign in 3/4" letters in top left hand corner where
the return address label would go. If you expect a large quantity
of foreign QSL cards, attach extra money or postage with a paper
clip; do NOT affix extra postage to envelope. Send the envelopes to
the QSL bureau for your callsign area. If your callsign is xx3xxx/5,
you would send it to the 3rd call area, NOT the 5th call area.
Addresses for QSL bureaus are listed in QST and on the ARRL e-mail
server (see below); if you don't have access to a QST magazine, ask
another ham. IMPORTANT: BE PATIENT! Turnaround time for a US QSL
bureau, not considering foreign QSL bureaus, is about 3 months.
Foreign QSL bureaus and hams can be as fast as 2 months or as slow as
TEN YEARS, while average is about 6-12 months.

Addresses for the US incoming and outgoing QSL Bureaus are available
from the ARRL e-mail server in the files called "qsl-in" and "qsl-out".
See the question above

** Are there any news groups for CAP?
There is no news group just for Civil Air Patrol discussions. However,
rec.aviation.misc is appropriate for CAP aviation discussions and for
CAP radio information, these rec.radio.amateur.* groups are available.
CAP-related files are also stored on the FTP site
sunburn.cps.udayton.edu in pub/capital.

** What's the name of the QRP club that issues QRP numbers?
QRP Amateur Radio Club International, c/o Bill Harding K4AHK,
10923 Carters Oak Way, Burke, VA 22015.

** How do I become a 10-10 member?
10-10 is simply an organization to sponsor the use of the 10 meter
band. It was first conceived when propagation was poor on 10 meters,
as a method to get more hams to use 10 meters. The past few years
have been great for 10 meters worldwide. However, "the bands are
closing down" again, and 10 meters will once again be limited more

for local communications, except for sporadic band openings, until the next sunspot cycle.

To join 10-10, work ten 10-10 members and LOG each 10-10 number, call sign, operator's name and location. Send the list to your numeric call sign or DX area manager (as shown below), with $5.00 U.S. new membership registration fee ($6.00 for foreign addresses).

10-10 International Area Managers:
USA 1 - Al Kaiser N1API, 194 Glen Hills Rd, Meriden, CT 06450
USA 2 - Larry Berger WA2SUH, 9 Nancy Blvd, Merrick, NY 11566
USA 3 - Chester Gardner N3GZE, 9028 Overhill Dr, Ellicott Cty,MD 21042
USA 4 - KY, TN, FL, VA, NC, SC only
Rick Roberts N4KCC, 7106 Ridgestone Dr,Ooltewah, TN 37363
USA 4 - GA, AL, Puerto Rico only
Jim Beswick W4YHF, 112 Owl Town Farm, Ellijay, GA 30540
USA 5 - Grace Dunlap K5MRU,* Box 445, LaFeria, TX 78559
*summer addr Jun-Oct Box 13, Rand, CO 80473
USA 6 - Dick Rauschler W6ANK, 4371 Cambria St, Fremont, CA 94538
USA 7 - Willie Madison WB7VZI, 10512 W Butler Dr, Peoria, AZ 85345
USA 8 - John Hugentober N3FU, 4441 Andreas Ave, Cincinatti, OH 45211
USA 9 - Jim Williams N9HHU, 240 Park Rd, Creve Coeur, IL 61611
USA 0 - Debbie Peterson KF0NV, RR 1 Box 35, Duncombe, IA 50532
All DX- Carol Hugentober K8DHK,4441 Andreas Ave, Cincinatti, OH 45211

** How do I join MARS?
To join MARS, you have to be 14 years or older (parental consent required under age 17), be a US citizen or resident alien, possess a valid Amateur Radio license, possess a station capable of operating on MARS HF frequencies, and be able to operate the minimum amount of time for each quarter (12 hours for Army and Air Force; 18 hours for Navy-Marines). Novices must upgrade to Technician within 6 months, else be dropped from MARS. No-Code Techs can apply, provided they have transmit and receive HF capability for MARS frequencies (they don't need transmit capability for Amateur HF frequencies). For application forms contact:

Chief, Air Force MARS
HQ AFCC/SYXR (MARS)
203 W. Losey St. Room 1020
Scott AFB, IL 62225-5219
(618)256-5552 Fax: (618) 256-5126

Chief, Army MARS
HQ, US Army Information Systems Command
ATTN: AS-OPS-OA
Fort Huachuca, AZ 85613-5000

Chief, Navy-Marine Corps MARS
Naval Communication Unit
Washington, DC 20397-5161

** How do I join RACES?
Contact your nearest Civil Defense or Emergency Management Agency.
The Radio Amateur Civil Emergency Service is a part of a municipal,
county, or state government. This does not mean, however, that
every such government has a RACES program. If your government does
not have a RACES, ask them to refer you to the nearest jurisdiction
that does have a RACES program.

** What organizations are available to help handicapped hams?
Courage Center
Handihams
2915 Golden Valley Rd
Golden Valley, MN 55422
(612) 520-0515
ARRL has a Handihams information package (get it by requesting it
thru 2155052@mcimail.com) and a book called "The ARRL Plan for the
Disabled", available at no charge from the ARRL Regulatory
Information Branch.

** I am looking for a specific ham, can anyone help me find him?
Rather than sending out a message on Usenet, you might first try
directory assistance from the phone company or the locator service
provided by the Salvation Army. A Salvation Army post in your
local area may be able to help you. If you have his/her callsign
or name, you might also try one of the on-line callservers shown
above. Also, the Quarter-Century Wireless Assn maintains a collection
of callbooks going back to "the beginning of time". Their address
is: 1409 Cooper Drive, Irving, TX 75061. Also, the Callbook has a
dial-in line for accessing new ham callsigns. Try (1-708-234-8011)
at 2400 baud.

** Can I post my neat new ham related program on rec.radio.amateur.misc?
This is really not a good idea, since many of the readers receive
these newsgroups as mail digests. Posting is also a one-shot thing.
If you post and someone missed it, it is gone. A better way would be
to announce the existence of your program here, along with
information on how to obtain a copy of your program. You can also
submit it to one of the FTP archive sites, which will allow the world
to access it without you having to mail it to each requestor. If you
just GOTTA post it somewhere, post it to more appropriate groups,
like comp.sources.unix or alt.sources or comp.binaries.ibm.pc.

** Where can I get ham radio software for my computer?
Atari: John Adams KC5FW, 17106 Happy Hollow, San Antonio, TX 78232
"or tune into the weekly net Sundays 1600 UTC on 14.325 MHz".
MacIntosh: MacNet, John Seney WD1V 144 Pepperidge Dr, Manchester,
NH 03103 (sent 2 800k FORMATTED diskettes, one of which
contains a TEXT file containing your name, address, home PBBS,
your radio & computer interests and equipment).

(See also the information about Anonymous FTP and ham-related
telephone BBS's above.)

** Are there Dialup News services or BBSs for Amateur Radio?
There are two major news services for ham radio. Both are run by volunteer hams and provide bulletins of specific interest to amateurs, hence they are perfectly legal to rebroadcast on ham bands according to FCC Regulation 97.111B(6). To lessen the load on the dialup lines, consider getting your local repeater operator to rebroadcast it, or tape record it to play at your favorite HF net.

RAIN (Radio Amateur Information Network) is produced by Hap Holly, KC9RP, located in Illinois. The news is typically updated 8am CST Fridays. Phone numbers are 1-708-299-INFO (299-4636) and 1-708-827-RAIN (827-7246).

NEWSLINE is another, produced by Bill Pasternak, WA6ITF. Donations for NEWSLINE are accepted at Newsline Support Fund, c/o Dr. Norm Chalfin K6PGX, Pasadena, CA 91102. Phone numbers are:
Chicago 1-708-289-0423
N.Florida 1-407-259-4479
West Palm Beach 1-407-965-1234
Los Angeles 1-805-296-2407 (Instant Update Line)
Los Angeles 1-213-462-0008
NYC 1-718-353-2801
Ohio 1-513-275-9991
Seattle 1-206-368-3969

** Where can I find VE sessions in my local area?
VE sessions are often announced in the local newspapers, but more often, they are announced by local radio bulletin boards. The local packet BBS will most likely have a monthly updated schedule for VE sessions. ARRL or W5YI can generally be called and asked for local VE sessions as well. Don't forget that you will need the following when you go in for an upgrade: a copy of your current Amateur license; your original Amateur license; any CSCEs (duplicate not required), if applicable and less than a year old; a picture ID, preferably a driver's license, passport or visa; and the VE test fee (approximately $5 right now).

Bart Jahnke, KB9NM, the ARRL VEC Manager (bjahnke@arrl.org) posts a definitive listing of VE exams indexed by state (and some overseas sites, usually at embassies and military bases) to the net every 6 weeks or so.

** Why isn't XXX available electronically?
This is a theme for a lot of common questions. For the "XXX" above, substitute any of the following:
Callbooks
DX QSL Lists
Radio station lists
ARRL publications (i.e. conference proceedings, repeater directory)
and more...

Except for the Callbook (via callsign servers), these are not available because of any of several reasons. Either there are copyright restric-

tions, royalty fees, or the source just may not have done the work.
Also, not everyone that has information has reliable UseNet access.

In one example of someone's effort to bridge the information gap, there
is a new repeater-mapping project which can automatically accept
entries via e-mail. If you can get enough details about a repeater
for a complete listing, you may want to help by submitting an entry.
For more information, use the following e-mail addresses:

repeaters@wattres.sj.ca.us
Just send a message with only the word "help" in the message
body. The project's software will reply with instructions.
steve@wattres.sj.ca.us
For other questions (Steve Watt KD6GGD)

As soon as the list is big enough to be useful, the project will make
it available electronically. That will mean one less "why isn't it
available electronically" question for the net.

2136. rec.radio.amateur.misc Frequently Asked Questions (Part 3 of 3)

Newsgroup: rec.radio.amateur.misc
Date: 1993-05-07 09:43:12 UTC

Rec.radio.amateur.misc Frequently Asked Questions
Part 3 - Amateur Radio Advanced and Technical Questions
------------------------------------------------------------------------------

Questions discussed in Part 3: (dates indicate last modification)
** What are the different US amateur classes and what can each of them do?
(pre-4/92)
** What is the best way to learn Morse Code? (10/92)
** What is the standard for measuring Morse code speed? (pre-4/92)
** I'm confused. What do all those abbreviations mean??? (5/92)
** What do all those "tones" mean? (pre-4/92)
** Where can I learn more about Amateur Radio if I live outside the US?
(4/92)
** How can I get a "reciprocal license" if I am a licensed ham from another
country or if I am a FCC licensed ham who wants to operate in another
country (on vacation)? (11/92)
** My apartment or housing complex does not allow outdoor antennas, now what
do I do? (pre-4/92)
** I got TVI...HELP!!! (pre-4/92)
** Did you know that you can get college credit for being a ham? (pre-4/92)
** On what frequencies do JPL and GSFC retransmit the shuttle audio?
(10/92)
** Can I take my HT on an airplane and operate it if I get the permission
of the captain? (4/92)
** How do I modify my current Amateur license? (4/92)
** I'm confused about XXX, should I ask the FCC? (4/92)
** Is there any information on antique radios? (pre-4/92)
** Where can I buy vacuum tubes? (pre-4/92)
** What do I need to get started in packet radio? (5/92)
** What do I need to get started in satellite communications? (pre-4/92)
** What is available to get started in ATV, SSTV and WEFAX? (5/92)
** What are these contests I sometimes hear, and how do I participate? (7/92)

--Rec.radio.amateur.misc Frequently-asked Questions------------------Part 3--

** What are the different US amateur classes and what can each of them do?
Novice - has CW (Morse code) privileges on 4 HF bands (80, 40, 15,
and 10 meter), Voice privileges on 10 meters, and privileges
on 2 VHF/UHF bands (220 MHz and 1290 MHz).
Required are 5 wpm Morse code test and 30-question Novice test.
```

Technician - has full privileges on all VHF/UHF bands above 30 MHz.
Required are Novice test and 25-question Tech test.
Technician may access Novice HF bands by passing the 5 wpm Morse
code test.
General - has all Technician privileges, plus larger access to more
HF bands, including CW and Voice on 160, 80, 40, 30, 20, 17, 15,
12, and 10 meter bands. A General class amateur can give Novice
tests.
Required are 13 wpm Morse code test, Novice, Tech and 25-question
General test.
Advanced - has all General privileges, plus wider band access on 80,
40, 20, and 15 meter bands. An Advanced class amateur can
also become a VE and give tests to Novice and Tech tests.
Required are 13 wpm Morse code test, Novice, Tech, General and
50-question Advanced test. The Advanced test is the most difficult
of the five written tests.
Amateur Extra - has full privileges on all amateur bands. An Extra
can become a VE and give all amateur tests.
Required are 20 wpm Morse code test, Novice, Tech, General,
Advanced and 40-question Extra test.

** What is the best way to learn Morse Code?
This is becoming an increasingly common question as many "no-code"
Technicians realize they can add more privileges to their license if
they learn Morse Code. The following list of suggestions should
be helpful in finding ways to approach the effort.

* Listen to code at a rate faster than you can copy.
* Participate in Novice-Roundup and/or Field Day. Practice whenever
you get the chance!
* Avoid the "deciphering" plateau around 5 WPM and and character
plateau at 10 WPM by listening to the fast Farnsworth-paced
"beat" of each letter and the "beat" of common words. (See the
question on Morse code speed for more information on Farnsworth
pacing.)
* Practice to develop a "copy buffer" so you copy about 5 characters
behind. (This is not easy but it's how the higher speeds are done.)
* Practice both with headphones and "open-air" copy as the code test
may be in either format. (If you only practice one, you may fumble
on the other.)
* Most of all, don't give up! Recognize when you reach plateaus
and keep trying until you break through them.

** What is the standard for measuring Morse code speed?
The word PARIS was chosen as the standard length for CW code speed.
Each dit counts for one count, each dash counts for three counts,
intra-character spacing is one count, inter-character spacing is three
counts and inter-word spacing is seven counts, so the word PARIS is
exactly 50 counts:

```
PPPPPPPPPPPPP AAAAA RRRRRRRRR IIIII SSSSSSSSS
. - - . . - . - . . . . . .
1 1 3 1 3 1 1 3 1 1 3 3 1 1 3 1 1 3 1 1 1 3 1 1 1 1 1 7 = 50
^ ^ ^
^Intra-character ^Inter-character Inter-word^
```

So 5 words-per-minute = 250 counts-per-minute / 50 counts-per-word or one count every 240 milliseconds. 13 words-per-minute is one count every ~92.3 milliseconds. This method of sending code is sometimes called "Slow Code", because at 5 wpm it sounds VERY SLOW.

The "Farnsworth" method is accomplished by sending the dits and dashes and intra-character spacing at a higher speed, then increasing the inter-character and inter-word spacing to slow the sending speed down to the desired speed. For example, to send at 5 wpm with 13 wpm characters in Farnsworth method, the dits and intra-character spacing would be 92.3 milliseconds, the dash would be 276.9 milliseconds, the inter-character spacing would be 1.443 seconds and inter-word spacing would be 3.367 seconds.

** I'm confused. What do all those abbreviations mean???
AM Amplitude Modulation
AMSAT Amateur Satellite Corporation
AMTOR Amateur Teleprinter Over Radio. A more sophisticated version of RTTY. Also used commercially as SITOR (Simplex Teleprinter Over Radio).
ARRL American Radio Relay League
ATV Amateur Television - a way to see who you're talking to!
CAP Civil Air Patrol is a volunteer organization that searches for downed aircraft and missing kids and uses frequencies just outside of the ham bands and often uses modified Amateur radios
CB Citizen's Band radio, this is NOT part of Amateur Radio and does not require any license to operate
CQ An on-the-air request for a conversation with anyone
"dupes" A dupe sheet is a duplicate check sheet, in matrix format, used to quickly check that you have not had a "duplicate" contact with someone (on a specific band or mode) in a contest
Elmer An amateur radio mentor, or "Master Craftsman" to a new ham. Could refer to anyone, regardless of age or gender.
FCC Federal Communications Commission, the "law enforcers"
FM Frequency Modulation
FieldDay A June activity to practice emergency communications for 24 hours....wives call it 'an exercise in male bonding' :-).
HF High Frequency - 3 MHz to 30 MHz
HT Handy-Talky, a shorthand for "hand held radio"
LF Low Frequency - 30 kHz to 3 MHz
MARS Military Affiliate Radio System, military affiliated Amateurs who provide free communications for overseas GIs and other Federal services. MARS operators are licensed under DoD instead of FCC.
NTS National Traffic System, a way to send radiograms
OF Old Friend, or Old F#$%, used to denote an older ham

OM Old Man, refers to any ham, including female hams
packet computer bulletin boards/electronic mail via Amateur Radio
PRB Private Radio Bureau, administers Amateur and CB services
QSO One of the Q signals used in Morse code to mean "conversation"
QCWA Quarter Century Wireless Association, membership means you've
been a ham for more than 25 years
RTTY Radio Teletype - older form of computer communications on HF
SAREX In Amateur Radio talk, Shuttle Amateur Radio EXperiment, a
chance to talk to astronauts in space. In CAP talk, Search
and Rescue EXercise, practicing for the real thing.
SK Silent Key, a nice polite way to say a ham has passed on "to
that great antenna farm in the sky"
SSB Single Side Band - need less band width than AM or FM
SSTV Slow Scan TeleVision - REALLY slow, low data rate, typically
used on the lower frequency bands
UHF Ultra High Frequency - 300 MHz and above
ULF Ultra Low Frequency - 30 Hz to 300 Hz
VHF Very High Frequency - 30 MHz to 300 MHz
VLF Very Low Frequency - 300 Hz to 30 kHz, audio frequencies
WARC World Administrative Radio Conference, a summit meeting that
occurs every few years, required by international treaty to
determine how the spectrum get sliced up to all vying
communications services (last one was in 1992)
XYL eX-Young Lady, or wife
YL Young Lady, non-ham girlfriend or female ham
2m Shorthand for "2 meters" (144-147.995 MHz), which is a
reference to the wavelength of a common Amateur frequency
band used for local communications

** What do all those "tones" mean?
Sub-Audible Tone: A low tone that you're not supposed to be able to
hear. It's used as a "PL Tone." PL is "Private Line", a trademark
of Motorola for their implementation of CTCSS (Continuous Tone Coded
Squelch System). Basically, the transmitter sends the signal with
the Sub-Audible tone and the receiver only opens when it hears signals
with that tone. Signals without the proper tone are ignored. This
is useful for "closed" repeaters, or for repeaters on the same
frequency that have overlapping geographic areas.
Tone encode refers to the feature of providing the tone on transmit.
Tone decode refers to the feature of responding to the tone on receive.
Tone squelch refers to all of the above. DTMF refers to Dual Tone
Multi-Frequency, or "Touch Tone" which is a trademark of AT&T. DTSS
probably means Dual Tone Squelch System and refers to the feature of
providing a predefined sequence of Touch Tone digits to open the
repeater for transmit. DTSS is an alternate method from CTCSS, which
provides a way to use a "closed" repeater even if your radio doesn't
do Sub-Audible Tones.

** Where can I learn more about Amateur Radio if I live outside the US?
Write to the ARRL and ask. They can usually tell you how to get a
license in your country.

If you know of any location where this information is available electronically, whether by an e-mail server, anonymous FTP, or a contact person, please mail it to us so we can include it here. Send it to hamradio-faq@amdahl.com.

** How can I get a "reciprocal license" if I am a licensed ham from another ** country or if I am a FCC licensed ham who wants to operate in another ** country (on vacation)?

Editor's note (11/92): the regulations affecting this question are being changed. Contact your local Volunteer Examiner (VE) and ask about a VE 60-day pass. More details will be included in future revisions of the FAQ.

This paragraph is soon to be obsolete:

You need to submit a FCC Form 610-A to the FCC, PO Box 1020, Gettysburg, PA 17326. They will then send you a reciprocal permit for alien amateur licensee (FCC Form 610-AL). You must be a citizen of a country with which the United States has arrangements to grant reciprocal operating permits to visiting alien Amateur operators.

This information is still current:

For FCC licensed hams operating abroad, the following guidelines apply:
* A reciprocal license is required in all foreign countries (that have a reciprocal operating agreement with the US), except Canada, where the FCC license is automatically valid.
* Send a SASE to ARRL Regulatory Information Branch, telling them which country you are going to visit and they will send you the info and an application form. Foreign hams can likewise request information from their national Amateur radio society.
* Submit your application with a certified copy of your Amateur license (ie, notarized copy), and fee if applicable (use a bank draft of a bank that does business in that country) to the appropriate licensing administration of the foreign country. Processing may take 30 to 90 days.
* If less than one month, you could try sending the application and pick up the permit upon arrival in that country.
* Most countries will not allow you to bring communications equipment into their country without a license or permit. If you applied, but haven't received the permit yet, show the copy and your FCC license to the customs officer, however, the equipment may still be held at customs until your departure.
* Be sure to use only those frequencies covered by your FCC license which are also used in the foreign country, unless otherwise authorized.

** My apartment or housing complex does not allow outdoor antennas, now what do I do?
First of all, don't despair. Many hams have similar problems. Many books offer advice for the growing group of hams that cannot put up

antennas. Some options are:
* Install an "invisible" antenna made of magnet wire.
* Disguise an antenna as a flag pole.
* Install an antenna in the attic.
* ASK the apartment manager. You may find they will let you put up something as long as it "is invisible" or "doesn't disturb your neighbors" or "doesn't attract lightning".
* Operate primarily from your car.
* If the restriction is due to local ordinance, you may have relief via PRB-1. Meet with the local government and seek an informal compromise. It is possible to win in court...but it's expensive and time consuming.
* If you are restricted by "covenants" attached to the deed of your home, your options are severely limited. Covenants are considered to be private, voluntary contracts between individuals and are outside of the intended application of PRB-1. In many cases, you can petition the Homeowner's Association for an exception. Sometimes you can win in court on the basis that other violations of the covenants by others without action taken constitutes abandonment of the agreement.
* For further information, contact the General Consel's office of the ARRL, 225 Main St, Newington, CT 06111.

** I got TVI...HELP!!!
Here's some hints on Television interference, but this is not a complete list. There are also books on the subject available from ARRL.
* If cable TV is an underground feed, look for central distribution box. Check for a grounding rod.
* Try installing torroids on the cable TV cable close to the TV, and maybe torroids on the AC cord as well.
* VCRs are notorious for RF leakers, try disconnecting the VCR.
* Check to see if interference is better or worse when cable is disconnected and you use rabbit ears instead. It could be the cable company's problem!
* Calling the cable company may get results, since they are also responsible for RF leakage from their equipment. However, they are very often obstinate. Good luck! Try some or all of these suggestions before calling the cable company:
1. Log the interference, noting geographical location, frequency, and characteristics.
2. Bring it to the cable company's attention in writing, preferably addressed to "Chief Engineer", or "Technical Staff".
3. Don't be accusatory, instead ask for assistance in resolving the problem. Try to work it out with someone technically knowledgeable.
4. Do mention your "licensed radio system", but try not to be too specific about "ham" or "CB" unless requested.
* Try moving the radio antenna further away from the TV sets. Make sure the SWR is LOW.

** Did you know that you can get college credit for being a ham?
It's true! You can receive up to 14 credits in electronics and
engineering thru placement tests for CLEP (College Level Entrance
Placement) exams and DANTES (Defense Activity for Non-Traditional
Educational Support) exams if you have an Advanced or Extra class
Amateur license. For more information, ask your campus education
office or (for DANTES) your military education office.

** On what frequencies do JPL and GSFC retransmit the shuttle audio?
Station VHF 10m 15m 20m 40m 80m Video
WA3NAN 147.45 28.650 21.395 14.295 7.185 3.860
W6VIO 224.04 21.280 14.282 7.165
K6MF 145.585 7.165 3.840
W5RRR 146.64 28.495 21.350 14.280 7.227 3.850
W6FXN 145.46
KA9SZX 146.88 426.25
K4GCC 146.94
WA4VME 145.17

All frequencies are in MHz. Use FM on VHF, USB on 10-20m, LSB on
40-80m.
WA3NAN - NASA Goddard Space Flight Center (GSFC), Greenbelt, MD
W6VIO - NASA Jet Propulsion Laboratory (JPL), Pasadena, CA
K6MF - NASA Ames Research Center (ARC), Moffett Field, CA
W5RRR - NASA Johnson Space Center, Houston, TX
W6FXN - Los Angeles, CA
KA9SZX - Champaign-Urbana, IL
K4GCC - Titusville, FL (near or at Kennedy Space Center)
WA4VME - Melbourne, FL (near or at Kennedy Space Center)

** Can I take my HT on an airplane and operate it if I get the permission
of the captain?

Technically, maybe. But don't count on it. In general, you can't use
a radio or scanner on an airline (or charter) *unless* the airline
allows it and the pilot-in-command (PIC) determines that it will not
interfere with the instruments and radios on that specific aircraft.
Very few US airlines allow passengers to use radios so be ready to
disconnect the antenna when you ask. (Don't even ask to transmit.)
For reference (in the US) the pertinent portion of the Federal Aviation
Regulations (FARs) is Part 91, paragraph 91.21.

Due to airport security, you may have a little difficulty carrying the
HT (or any electronic equipment) onto the airplane. Generally, you
can appease the security guards, simply by showing that the unit is
operational and doesn't have a bomb inside. For a radio, just turning
it on and opening the squelch satisfies them. Expect more difficulty
during periods of increased security.

On a private airplane, it is legal to operate an amateur radio if you
have the permission of the PIC. It is still possible for the radio to
interfere with the plane's navigation or communication equipment, so
be sure to ask first. Always obey the requests of the PIC. He knows

his airplane and radios better than you do.

** How do I modify my current Amateur license?
To modify your license (change of address, change of station location, change of name, renewal, or even change of callsign), submit an FCC Form 610 to the FCC. Forms are available from the FCC or ARRL or a local VE session or ham radio store. Do NOT use a photocopy. Check off the appropriate boxes, fill in the new/changed information, SIGN THE FORM, and attach a copy of your current license (or a brief letter of explanation for its absence, ie, "my dog ate it"). NOTE: If you check the box to change your callsign, YOU WILL GET A NEW CALLSIGN, even if all you wanted was to supply a new address; if you want to keep your callsign, DON'T CHECK THAT BOX. Send the form to FCC, POB 1020, Gettysburg, PA 17326. Turnaround time (for CURRENT licensees only) is about 2-4 weeks.

ANY ham can apply for a new callsign (this is different from the past where you can only get a new callsign if you move or upgrade). You can't specify WHICH ONE you want, a new one comes from the same pool as new licensees for that class of license. The callsign is based on your mailing address. For overseas military and civilians, be sure to specify a station location that is within FCC jurisdiction.

New licenses are for 10-year terms. If you apply for renewal before its expiration date, the expired license is valid for 60 days after expiration to allow for the new license to arrive. You have up to 2 years after expiration (5 years for an old 5-year license) to renew before re-examination is required (but you can't operate with an expired license). You will lose your current callsign after 1 year after expiration if you don't renew.

** I'm confused about XXX, should I ask the FCC?
Whatever "XXX" is in this case, the overwhelming ARRL and net opinion is a resounding "NO!", at least not as a first step. Amateurs are generally very law-abiding people and have historically written the FCC asking for clarification on some operating practice or another. This is a very dangerous practice, for several reasons.

Most amateur radio regulations (contained in Part 97) are generally very loosely-worded, so as not to restrict experimentation and new techniques. But asking the FCC for a clarification will set in motion the process of "clarifying" it for everyone (i.e. new rulemaking.)

Examples of such restrictive rulings include varying topics like when Hams can help non-profit agencies or effectively forcing packet BBS sysops to screen messages before forwarding them. They were the result of well-intentioned questions by Hams that forced the FCC to make a ruling where they previously allowed the amateur radio community to police itself.

Under all circumstances, it is better to first read the rules yourself. Then, if there's a problem, ask your national amateur radio organiza-

tion (such as the ARRL in the US) which can give qualified advice about interpretation of FCC regulations. Organizations like the ARRL also have the influence to ask the FCC informally, without forcing a ruling.

Even if asking the FCC doesn't result in a restrictive ruling, it is generally a good idea to not overburden an under-staffed and under-funded government agency with a lot of correspondence. The Amateur Radio Service has traditionally been a low-workload "hands-off" service, and has enjoyed a wide latitude from the FCC. Please don't ruin this image for your fellow amateurs.

** Is there any information on antique radios?
Antique radio classifieds: ARC, PO Box 802-B6, Carlisle, MA 01741 - old radios, TVs, ham equipment, 40s and 50s radios, telegraph, books, etc.
Hallicrafter Service manuals: Ardco Electronics, PO Box 95, Dept Q, Berwyn, IL 60402
Antique Wireless Association, Bruce Kelley, W2ICE, Route 3, Holcomb, NY 14469 - sponsors the Wireless Museum

** Where can I buy vacuum tubes?
Kirby, 298 West Carmel Drive, Carmel, IN 46032 (1-317-843-2212)
Antique Electronic Supply, Box 1810, Tempe, AZ 85281 (1-602-894-9503)
Fair Radio Sales, Box 1105, Lima OH 45802
Fala Electronics, Box 1376-1 Milwaukee, WI 53201
Southern Radio Supply, 1909 Tulane Ave, New Orleans, LA 70112 (10504-524-2343)

** What do I need to get started in packet radio?
Packet radio is a digital form of communication using radios. There are OTHER digital forms, as well, like CW, RTTY and AMTOR. To use packet radio, you'll need a radio (2 meters and 70 centimeters are most popular), a box that converts radio signals to digital signals that a computer can understand (called a TNC or terminal node controller) and a computer or terminal. For some computers or TNCs you may need special software as well. However, most TNCs and computers get along quite well with just a terminal emulator software package. Most personal computers can be interfaced to use with packet radio. Since there are many digipeaters, generally even an HT will work with packet radio.

Your first source of information on Packet Radio should be the rec.radio.amateur.packet newsgroup. It has its own regularly-posted FAQ that goes into much more depth on the subject than this one can. See also the mailing list and archives info in Part 2.

For more information on packet radio, you might try TAPR (Tucson Amateur Packet Radio), PO Box 12925, Tucson, AZ 85732 (602-749-9479).

** What do I need to get started in satellite communications?
For more information about Amateur Satellite Communications, try AMSAT (Radio Amateur Satellite Corporation), PO Box 27, Washington,

DC 20044 (301-589-6062). They also have an international net on Sundays on 14.282 MHz at 1900Z.

** What is available to get started in ATV, SSTV and WEFAX?
This is a large subject area in itself. Amateur Television (ATV), Slow-scan TV (SSTV), and Weather FAX (WEFAX) all deal with transmitted pictures. (ATV includes moving pictures and audio just like your household TV.)

Equipment is available to interface to most common microcomputers including PC clones, Amigas (which are prominent in most video applications anyway), Atari ST, and others. (At last check, we didn't see Macintosh on the list.) There are also a handful of publications on the subject.

All this information is available via FTP in the /pub/ham-radio directory at ftp.cs.buffalo.edu. (See Part 2 for more information on FTP.) The file called sstv_wefax_info is maintained by John Langner WB2OSZ (johnl@avs.com).

The ARRL e-mail server contains an introduction to SSTV in the file sstv-info. (See Part 2 for more information on the ARRL e-mail server.)

Another resource is the regularly-posted UseNet Elmers Directory. The list contains a volunteer Elmer who can help with ATV, SSTV, and WEFAX questions.

** What are these contests I sometimes hear, and how do I participate?

Dozens of contests are held each year, usually at weekends, and can provide useful operating experience. They typically last for 24 or 48 hrs, and are usually on SSB or CW only (the Russian CQ-Mir contest is on both modes at the same time). You can participate by making one QSO or several thousands. In most contests you send a signal report (traditionally 59 or 599) followed by a number that is different for different contests - the most common one is a serial number (so you send 599 001 for your first QSO, then 599 002 etc). The exchange may, however, be your age (All Asian contests), your CQ or ITU zone (CQWW and IARU contests, respectively), your state (ARRL contests) or something else. Read "Contest Corral" in QST for the rules for all major contests - the more serious contester may wish to subscribe to the National Contest Journal, or join the e-mail contest mailing group (write to Trey, WN4KKN, at garlough@tgv.com). Knowing the rules can prevent embarrassment - you will get a cool reception if you are a W or VE and call a W/VE in the ARRL contests, since they can only work non-W/VE stations. Otherwise, QSOs made in contests are just as valid for DXCC (DX Century Club - more than 100 contacts), WAS (worked all states) and other awards as are 30-minute ragchews. Although not strictly a contest, the annual Field Day provides very useful operating experience under less than optimal conditions and is highly recommended for new operators - check with your local club for their Field Day

plans some weeks before the (late June) event.

2137. OH0MFP qrv on 10m this weekend

Newsgroup: rec.radio.amateur.misc
Date: 1993-05-07 10:25:22 UTC
From: oh3mep@lehtori.cc.tut.fi
Message-ID: <1sddei$j59@cc.tut.fi>
Source record: 281999

Alpo, oh3mfp will be on Eckero on the western part of Aland Islands
this weekend. His activity will be depending on band conditions on 10m,
because he hasn't a change to take a lot of stuff with him.
He will use there callsign OH0MFP like during previous trips.
QSL via homecall.

de Pete , oh0mep

What do vacuum tubes have to do with code - they are both antiquated and while they have limited use, they have been replaced with more modern means. I do think that code should be kept alive though - as well as knowledge of vacuum tubes. Knowing your history gives a better perspective of the present.

Please explain to me how knowing code gives you some divine knowledge on how to build a dipole. I know some "coders" who couldn't build one either.

There are also general/advanced/extra class hams who can't remember a dot or dash of code two years after upgrading - because they never use it. How is knowing code helping them or keeping scumbag CBers out? And very few hams of any class actually make their own equipment - how would you change that - require all hams to build their own equipment as in the early days?

We actually agree on one point (how about that!) - the written tests are too easy and I agree that they should be made tougher (but after May 22nd, when I'll be taking my scumbag no-code test!).

Perhaps I was a bit hasty in suggesting the elimination or reduction in the requirements for code. I do see the benefit for use in the HF bands. But I also see that something needed to be done to get more into the hobby. I do plan to advance to extra class - code or no-code.

Yeah, it bends like a wet noodle! It shatters when bent while very cold.
It works great as plumbing, but sucks for antennas. Oh, did I mention that
it is quite a bit heavier than an equivalent size of aluminum?

My wifes grandmother is "loaning" me her dad's Vibroplex telegraph key for use.
Yay! This is a pretty neat key! I want to restore it as much as possible.
Several of the adjustment screws are bent, and the contatcts seem to be
corroaded a bit. Is there any kind of re-build parts kit or parts list that
I can order replacement parts from Vibroplex? This key was probably bought
sometime in the early part of this centurey. The design looks the same as the new keys that
they still sell.

Thanks for the help!

(now if I can only figgure out how to use it....)
Mitcheal

I guess, for me, it is a question of how much work, and expense, you are willing to endure inorder to make a material that was not designed for structural purposes, and is not very suitable for use as a supporting structure, into a supporting structure.

PVC tubing is fine as a substrate for traps, and baluns. It is ok structurally in very short lengths (eg. 5 foot length of 1 inch tubing); but for any longer lengths, the stuff cannot even support its own weight.

It just isn't even all that cheap to use if you have to guy it, and use multiple pieces bound together to get enough strength so that it doesn't droop.

A length of 1" PVC is actually heavier than 1" thin wall aluminum tubing. And the aluminum tubing is much stronger.

Just my opinion.

The American Radio Relay League (ARRL) has a useful service -- the ARRL
Information Mail Server. This is an automated mail server that let's you
access many of our information files, containing information about various
facets of Amateur Radio. You can retrieve any or all of these files by
sending an email message to info@arrl.org here at ARRL HQ. Each file you
request is then mailed to you automatically, usually within a few hours.

To use it, mail messages to:

info@arrl.org

Each line of the message should contain a command as shown below.
You may place as many commands in a message as you want. Each file
you request will be sent to you in a separate message. Only ASCII
text files are supported at present.

Valid INFO commands:

help Sends this help file
index Sends an index of the files available from INFO
send FILENAME Sends "file" example: send email
quit Terminates the transaction (use this if you have
a signature or other text at the end of the message.)
reply <address> Sends the response to the specified address. Put this
at the BEGINNING of your message if your From: address
is not a valid Internet address.

Note: your message will *not* be read by a human! Do not include any
requests or questions except by way of the above commands. Retrieve
the "EMAIL" file for a list of addresses of ARRL HQ humans :-)

2150. Problems with TH-78A mods

Newsgroup: rec.radio.amateur.misc
Date: 1993-05-07 14:19:21 UTC
From: gobbel@cogsci.ucsd.edu
Message-ID: <GOBBEL.93May7141921@cogsci.ucsd.edu>
Source record: 281878

Yesterday I tried to do the crossband repeat mod to my Kenwood TH-78A, after getting the instructions direct from Kenwood. I removed diode #4, from the row of six that the instructions described. After doing the mod, the radio could do crossband repeat, I was happy. BUT: as soon as I put some frequencies back into memory, when the radio was turned off and back on again, it would go into idiot mode, displaying only "channel numbers" instead of actual frequencies, and not allowing any new frequencies to be entered (resetting the CPU would bring it back, with its memory erased, of course). I thought perhaps I had screwed something up when I did the mod (still a possibility), but reinserting the diode returned the radio to its original state--so whatever I did, I didn't fry any of the other diodes. The possibility remains that I accidentally broke a PC trace that went through the diode's terminal (so that reinserting the diode restored it) but I don't think so. I plan to call Kenwood and ask them how well they've actually tested this mod--apparently everything looks normal until you program at least one frequeny into *each* band, then cycle the power. In the meantime: has anyone else had this problem? Has anyone done this mod and NOT had the same problem? If I've messed up the PC board, I think I'm going to be sick....

-Randy, KD6ULI

2151. Two-Line Orbital Element Sets

Newsgroup: rec.radio.amateur.misc
Date: 1993-05-07 14:32:41 UTC
From: tkelso@afit.af.mil
Message-ID: <rec-radio-info737080037@ve6mgs.ampr.ab.ca>
Source record: 281872
Cross-posted to: rec.radio.info,rec.radio.amateur.misc

The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, (513) 427-0674, and are updated daily (when possible). Documentation and tracking software are also available on this system. The Celestial BBS may be accessed 24 hours/day at 300, 1200, 2400, 4800, or 9600 bps using 8 data bits, 1 stop bit, no parity.

Element sets (also updated daily) and some documentation and software are available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space.news and rec.radio.info.
This week's elements are provided below.

>I've got an alternate method that you might want to try.

Here's a cross-hobby helpful hint I got from the amateur astronomy world: a
good way to stiffen up PVC is to put plywood stiffeners inside throughout it's
length, this being the end view:

```
---
! !
! !
-------------
! !
-------------
! !
! !
---
```

As you can see, you have to cut and glue together 3 very long, narrow pieces to
make this stiffener. It's supposed to come out a fairly snug fit in the PVC.

Nope, never tried it.

Fred.Lloyd@west.sun.com (Fred Lloyd) writes:

Sorry Gang, someone (ve6mgs?) has posted a private e-mail that I
sent out to a small group which offered the QRZ CD at a special
price. I reget to say that that I am unable to offer the CD to
the general usnet population (despite what the message says).
I have only a limited number of CD's myself and thus cannot fulfill
the offer to everyone who might asks as a result of this posting.

Due to the very limited supply of CD's that I have, I must restrict
my special private offering to those who actually received my e-mail.

As for everyone else, I heartily recommend that you give Walnut Creek
CD-ROM a call. At $24.95 the it's still a great value and by doing
so you will help to insure that future editions will be possible.

In addition, I will not be making any further postings regarding
the sale of CD, so as to not use this forum for business purposes.

Thanks for all your support and let me offer my apologies for any
confusion this may have caused.

>
>Assuming I pass the exam (probably not much of a problem), I've been
>told that I'll be given an opportunity to choose my new Canadian call
>sign from at least a subset of the unused calls in my area (VE3xxx).

Around here (VE7 land), most people either pick one at random, or
incorporate their name in their call. You'll be able to pick any
available VE3 call. Since each Communications Canada owns a certain
series of calls, they may need to get your selection released from a
different office, which can take anywhere from a couple of days to a
couple of weeks.

I picked a call at random at first (VE7MCR), but found it didn't
work well on the air. It kept getting confused with VE7NCR, and yes
I know my phonetics, but such confusion is a bit much on 2m NBFM.
So I went down to the Communications Canada office and got my initials
in my call (VE7LDH), and haven't had any problems since. The Prince
George office assigns VE7Lxx calls, but it only took 2 days to get the
release from them; Vancouver were able to verify that the call was
available on the spot.

Actually Mark is blameless in this one. At first glance, your E-mailed
message looked identical to the one that you had posted to news (and
it seemed to contain an offer that was directed to all of Usenet). So,
I passed it on to rec.radio.info without realizing that it was private
information.

Sorry for the confusion also.

>so it could be used for eavesdropping. 'Every cellular phone is a scanner,
>and they are completely insecure', Sun Micro's Gage said.
> "His example underlined the problems of trying to legislate safeguards in
>cyberspace. Only last year, the subcommittee originated what became a law
>that makes illegal the use of scanners to eavesdrop on cellular conversations.
>Who needs a scanner?"

I keep seeing references to this being done. A similar article was posted
to one of the other groups recently talking about how two guys interfaced
a computer to a cellular phone and used it to track the calls and even location
(to the nearest cell site) of local cell phone users.

How is all this done? Can these things be unlocked just from the number
pad or is more involved? Do cell phones already have a computer interface
built-in or did these guys have to invent one?

If anyone has details on this stuff, please post.

73,
Harold

2163. TM-941 self-resets!

Newsgroup: rec.radio.amateur.misc
Date: 1993-05-07 18:25:28 UTC
From: mead@hamal.usc.edu
Message-ID: <1se9io$3qk@hamal.usc.edu>
Source record: 282018

My Kenwood TM-941 (2m/440/1.2Gig) xcvr will randomly reset all vfo's
and memories. I made certain that no obvious wires were shorting,
the power to the radio is stable. This has happened about 6 times,
so far, over a period of a year. The radio can be idle, monitoring.
It can be off, and when turned on, it has reset. All vfo's and all
memories on all 3 bands revert to default. This leads me to believe the
controller is at fault, but I am curious if anyone else has experienced
this?

Thanks,
Dick WB6NGC

From: brian@amdcl2.amd.com
Message-ID: <C6o6vp.M71@amdcl2>
Source record: 281893

The New York Times, Friday, May 7, 1993, lead article, front page:

"But Radovan Karadzic, the Bosnian Serb leader, shrugged off the reaction, and his fighting units were reported by ham-radio operators to be close to capturing the Muslim enclave of Zepa after a long bombardment."

Same paper, page 7, subtitle & article:

"Ham Radio Reports Breaking of Defense Lines Around Muslim Town of Zepa"

"The ham radio reports of the Zepa assault remain unconfirmed because there are no independent observers in the area." Approximately one third of the article was direct quotes from "Mr. Fadil Heljic, a ham radio operator in Zepa, whose broadcast was monitored in Bosnia's capital, Sarajevo."

And from me, personally, a call for a moment of silence and contemplation on this war and the many who have and will die from it.

Nope, the law explicitly provides an exception for law enforcement
organizations. (ATF, FBI, CIA, local police etc.)

In other words, as far as the law is concerned, the police have
a right to privacy and you dont.

In my opinion the law is unconstitutional on precisely that ground.
The restrictions against violating the right to privacy which have
been read into the constitution apply to government and not to
individuals. (Laws, statutes, and regulations restrict citizens.
The constitution is a document which determines which laws
government may or may not make.)

>Cordless phones do not operate in the cellular phone bands. The manufacturers
>of cordless phones did not have a big enough lobby to get them included in
>the ECPA law.

I didn't think it was the ECPA that's being discussed, but after re-reading
the orginal posts, I guess it was. My reference was to the new scanner
legislation that will prevent getting FCC approval for equipment that can
automatically switch between 4 or more frequencies in the 30-960 MHz band.
Most cordless phones operate in the 49 MHz band and many can switch between
up to 10 different frequencies. And as was mentioned in a previous post,
so does much of the public service equipment.

Gotta love them congresscritters and their amazing ability to create more
ridiculous legislation than is imaginable. Let's downsize the government
starting with the legislative and executive branches.

|N9MWB

Well the law seems to be enforceable in the sense that it only prohibits the manufacture or importation of cellular capable scanners. It will not be illegal, for example to homebrew one or two in your basement. (The wording might make it illegal to sell these but I'm not sure.)

I wonder if you might see people selling kits? ;^) After all they could allways sell you the kit for the non-cellular capable scanner, which cannot be easily modified to be a cellular scanner, unless of course you are building the whole thing from a kit, say, and are etching your own board etc. ;^)

I heard the Russian space station MIR on my scanner (PRO-2006 using built-in whip, 145.55 MHz) last week and would like to know where to send my reception report for a QSL card. Thanks!

Tom, your mention of Amateurs being excluded in many laws from scanner bans brings up an interesting point. Since most modern amateur transceivers sold today are 'scanners,' it might be impossible for municipalities to ban their use by liscensed amateurs, since we have federal permission to operate such equipment.

You might point out the matter of Hams to the Chicago City Fathers and see if it will effect them. Hams are a great asset to all government and public safety. I really think that the problem lied between the Public's right to the Public airwaves and the prohibited use of the information heard for profit and gain.

* STS-55 NEWS *
===============
Ground stations who captured SAREX telemetry are asked forward this
information to the Working Group so the SAREX team can have a compiled
log of the stations who were heard by the shuttle. Please send any
packet downlink data you have obtained for this mission to:

STS-55 Packet Logs
c/o Frank Bauer, KA3HDO
1804 Hopefield Rd
Silver Spring, MD 20905

Please use a PC-compatible disk (3.5 inch preferred) and store the data in
an ASCII format. The SAREX team will then compile this information into a
database, similar to the service provided by Tom Clark, W3IWI, for the
STS-35 mission. If there is a group interested in compiling this data,
please contact Frank Bauer at his home address (above) or on E-Mail:
ka3hdo@amsat.org

As with all SAREX flights, a special QSL card is planned for this mission.
If you made a 2-way contact with the crew or hear the SAREX downlink, you
qualify for a QSL card.

The IBM Amateur Radio Club of Boca Raton, Florida has volunteered to act
as the QSL manager for the STS-55 SAREX mission. For the STS-55 mission,
please send your QSLs to:

IBM Amateur Radio Club/1993
PO Box 1328
Boca Raton, FL 33429-1328
U.S.A.

On the outside of the envelope, please write STS-55 SWL or STS-55 QSL-2-Way depending on whether you heard the downlink or made a two-way contact.

For all QSLs, it is essential that you include an Self-Addressed, Stamped Envelope (SASE) using a large (4 inch x 9.5 inch) envelope. If an SASE or sufficient IRCs are not included with your signal report you will not receive a QSL card.

[Info via Frank H. Bauer, KA3HDO for the SAREX Working Group]

* DOHOP TEST PROPOSED SCHEDULE *
==========
DoHoP #3 experiment is planned for May 16th 1993. Data below is for Lincoln UK, IO93RF. Times given will be minus a few seconds on the date. Stations wishing to participate are asked to uplink to RS14/AO21 using CW or LSB between 435.100 and 435.110 MHz maintaining a constant uplink freq. Call "CQ DoHoP de your callsign". If not taking part by transmitting, please listen for DoHoP signals on RS-10 mode A. Reports are welcomed with particular attention to UTC, frequency, and location of station.

North American reports by packet to : W2RS @ WA2SNA.#NJ.USA.NA or via Internet to w2rs@amsat.org
European reports by packet to : G0NKA @ GB7DTX.GBR.EU
" " " QSL to : G4CUO via Bureau

Set shack clocks to GMT accurate to within 1 second before the 11:00 pass of RS-10. RS14 will be switched at 10:00 GMT by RS3A in Moscow. If all goes okay, then slottime = 7 mins 02 secs (11:08:48 to 11:15:50). TCA between RS10 and RS14 occurs at 11:11:22.

> It might be impossible for municipalities to
> ban their use by liscensed amateurs, since we have federal permission to
> operate such equipment.

No, it is quite possible. A number of states have done exactly that. For example, while I lived in NJ, a law was passed making it illegal to have a radio capable of receiving frequencies allocated to the government, police, or fire. It didn't even have to be on or accessible. Nearly all ham rigs are technically illegal because of overlapping allocations. A ham was arrested on this charge (while he was helping the local police track a jammer even, lots of thanks for the assistance, copper).

The ARRL asked for a preemptory ruling from the FCC (like PRB-1). The feds are very reticent (probably rightfully so) to preempt local laws. They even asked if the ham rigs could be modified to be brought into compliance. I.e., no dice at this point in time.

Fortunately, the amateur community in the juristictions that are affected have been able to get the laws changed in their favor.

-Ron

2178. SURVEY: USED HF RIG PRICES

Newsgroup: rec.radio.amateur.misc

>converted to WARC XMIT yet, but I just got the mods info from another
>'netter.

Wow, $650 seems pretty high for a used 740.

To help everyone on the net get better information on used HF
rig prices, I am doing a survey. If you have sold or bought
a used HF rig in the past 3 years, I would like to hear from
you. What I would like is the following information:

RIG: Make and model of the radio. I would like to limit this
to amateur radio HF transceivers. Any make, model, or year
of manufacture is fine.

BOUGHT/SOLD: Whether you bought or sold the radio.

METHOD OF SALE: Did you buy the rig from:

- A hamfest or flea market? If so, which one?
- From a retailer?
- From a sale using Usenet?
- From a private sale not involving Usenet?

PRICE: Price of the rig you paid or sold it for.

CONDITION:

- New: In the box, never used
- Good: Nearly new, works fine, maybe a few superficial scratches
- Fair: Scratches or other outside problems, but few if any
operating problems.
- Poor: Required major repair or modification

ADD-ONS: What add-on features did the unit have, if any. (e.g.
CW filters, tone units, DSP, etc.)

I will post summary information from the survey.

I am not affiliated with any retailer or anyone else who
makes money off ham radio.

> I'm surprised that there is still confusion over this issue,
> particularly among those who have been on the net a while.

"Most major newsreaders." With that phrase, I continue to see the problems experienced by users of newsreaders that *don't* deal gracefully with xposting completely discounted.

Yet every time something like this comes up, lots of folks complain about excessive xposting.

The bottom line is that "Most major newsreaders" aside, a lot of *READERS* (you know, the humans who use these services) are troubled by excessive xposting. I'm stuck learning to live with xposting, but good grief! A newsgroup intended as a target for xposting!? That's just too much! I wish people would recognize the simple fact that for many of the *users* of the net, (who *cares* about the newsreaders) have problems with xposting. Would you at least recognize that this is a real problem for many folks.

To quote Paul, I'm surprised that there is still confusion over this issue, particularly among those who have been on the net a while.

BTW, I use a UN*X based newsreader, used by a large portion of Hewlett-Packard. It knows nothing of xposting. Many HP sites are moving to tin, but many (including mine) currently are not. I have no choice in newsreaders. Many other users are in similar positions.

Sorry for the tone of this posting, but it's a topic of some frustration. And please, at the very least, respect the fact that xposting causes many of us problems, even if you intend to ignore those problems.

I prefer the idea of the radio being sold as a receiver only with access
to the entire 800MHz spectrum and then have a keyboard mod to enable 'scan'...
This isn't prohibited in the law, right? I mean...if it isn't sold as
a scanner, then it should be exempt.....one should be able to easily mod the
radio to scan.....Or will they try to come up with a law against that too...?
:-(
What's this nation coming to when you can't even keep tabs on your
local law enforcement to make sure that they're doing the job we pay them to
do??? ;-)

Well as I was away at college I was not privy to the fact of that NPRM.
would have certainly responded in a negative fashion. It should only be
amateur radio operators who are allowed to respond to NPRM's concerning
amateur radio. I am sure W5YI and the ARRL pushed hard for people to right
in in a positive way. (This has been convered before).

>The Amateur Service exists for the benefit of all the citizens of

& I'm looking for experiences on the Ramsey amplifier kits...
& How reliable are they (esp. the PA-10) Can they be easily
& converted to other bands (e.g. 10 m)? Are there any other
& companies that I should try?

I built one of their 2 meter amps. The kit had two problems:

1) One of the variable capacitors ran out of range, so I added a
small fixed capacitor in parallel (I think it was on the input
and I added a 10 pF Mica).

2) The amp oscillated. I put a 10 ohm resistor from the base of the
transistor to ground. The input impedence of the transistor in the
2 meter band is very low-on the order of 1 ohm, so the 10 ohm resistor
has no measureable effect on the gain or level of the signal in the 2
meter band.

Now it works great and I am happy with it. I get about 35 watts out
for 5.5 watts (FT-470 running at 13.8 volts) input.

>ran the lights.

Most of the 2M interference I hear is from anti-lock braking system
microcontrollers including, unfortunately, the one on my new S10.

>Any ideas, how to get a new one in?

Pacific Coast Parts in Gardena, CA distributes parts for Kenwood.
I have had very good service from them. They handle orders
charged to credit cards by phone: 800-262-1312. They also have
the service manuals.

Yes, kill files are the answer. For example, if the rest of you are
tired of reading rude and impolite posts like the above, the following
entry in your kill file will solve the problem:

/: *nm1z@anomaly.sbs.com/h:j

The net works only if we all cooperate. Discussions of code/nocode
does belong in this group. Unless the situation improves, I'm afraid
the only solution is moderation.

I'm pretty sure it's not fluorescent lights... they're neon. I've seen
it around license plates and under cars too.

> Whats with the lights? Is this a new fad straight out of Deetroit?
> Are the "Low Riders" traiding in their hydrolics for light show equipment?
> Am I square?

Nope you're not square, you're just not a homey. Homey's love makin'
their cars look, um, different from the rest as though tinting all the
windows black, putting gold trim all over the car, and having vanity
plates isn't enough. :)

> I guess I'll have to tape a flourecent tube to my low band Hustler and
> operate some mobile VHF at night.

Nah... just a little neon ball at the tip of the antenna. That'd get
some interesting looks.

VK2SG RTTY DX Notes, 7 May
VK2SG RTTY DX Notes for week ending 7 May 1993 (BID RTDX0507)

We hear from some that there is not much activity on RTTY. What is
all this Bandpass from the past week, a pipe dream?

Our information this week came from BY1QH, CE3GDN, DJ3IW and the
Central Europe DX-Cluster Node DB0SPC, I5FLN, IK5AAX, KE6XJ, N4SO,
VP8CIL, W2JGR and the NJ0M Node Twin-Cities DX Packet Cluster Network,
W5KSI, ZS5S. Thank you all for your assistance.

Anything that could broadcast to a "village" would be far more powerful
than the tiny wireless microphones allowed by law.

Are you thinking that perhaps your professor will be impressed with your
ability to break FCC regulations? Or are you just really, really dying
to get a close look at that yellow truck with the loop antenna on top?

Get smart. Don't do this.

Scott

QST de W1AW
ARRL Bulletin 52 ARLB052
>From ARRL Headquarters Newington CT
May 7, 1993
Relayed by KB8NW/OBS & BARF-80 BBS
To all radio amateurs

SB QST ARL ARLB052
ARLB052 Fines for pirate operation

Three Washington state men have been fined 2,000 each by the FCC
for unlicensed operation on 2 meters.

The FCC received a complaint from an amateur on November 17, 1992,
alleging that people aboard fishing vessels were operating on
144.170 Mhz. The FCC agent was unable to receive adequate signals
from the operations and asked for a tape recording from the
complainant.

The FCC conducted an investigation, using telephone, marina, and
U.S. Coast Guard information to identify the source of the
transmissions.

The FCC said that since all three accused men were individuals
(rather than commercial operations) and because of the nature of the
violations and the fact they were first offenses, it would set the
fines at 2,000 instead of the 8,000 ''base forfeiture'' set by its
rules.

receiving notices of apparent liability for 2,000 were Randy
Baxter, Kevin Marilley, and Mark Karuza, all of Bellingham,
Washington.

Relayed by KB8NW/OBS & BARF-80 BBS
To all radio amateurs

SB SPCL ARL ARLX006
ARLX006 W6NAZ Silent key

Lenore Jensen, W6NAZ, died May 5, 1993, in Sherman Oaks, Calif. She
was 79 years old, the widow of Robert Jensen, W6VGQ, and one of
amateur radio's premier ambassadors.

She was first licensed as W9CHD in 1939, in Chicago, where she was a
contract actress for NBC. She became W2NAZ upon moving to New York
city in 1940, and then W6NAZ after the second World War, when she
and her husband, Joe, W2MSC, moved to Hollywood.

Most of her operating involved message handling and phone patching.
She ran 68,000 Army MARS phone patches during the Vietnam War,
according to a profile in QST for December, 1987.

Lenore Jensen was one of the 13 surviving founders of the Young
Ladies Radio League, and the 1983 Dayton Hamvention Special
Achievement Award winner. She was especially important to amateur
radio public relations, interviewing stars and celebrities for radio
''SPOTS.''

Survivors include two stepchildren, Cindy Wall, KA7ITT and Stephen
Jensen, W6RHM.

Funeral arrangements are pending. In lieu of flowers memorial
donations may be made to the ARRL Foundation, the Los Angeles
recordings for the Blind ASSN., or the American Cancer Society.

I wanted to get an amp for my HT... So I could have better mobile usage..

nothing incredible.. 20-60 watts output.. but I dont have enough money for a mobile.. but I still need to use my HT while I am driving.. SO.. a mobile amp sounds like a nice idea..

if anyone has the plans to do this.. or knows where I can get the plans or a kit (that they KNOW works) PLEASE tell me...

Post it back to me.. or email.. but posting would be better.. since there are probably people out there who would find this interesting !!

>
>Well the ARRL did not support no-code for the longest time and I have
>oodles of QST ariticles to prove it. Then they did an about face
>because of the $$$. ARRL does not represent a majority of hams anyway.

The League had to be dragged kicking and screaming into the later half of the twentieth century, mainly by efforts of QCWA, TAPR, AMSAT, et al. Now certain League officials may be venial, but even so it's hard to see how they would personally profit much from greater membership in the association. Certainly the salaries of the paid staff don't reflect prosperity, and the elected officials aren't paid, except for per diem expenses. The League may not use membership funds efficiently, but they are mostly poured back into membership services. Accusing them of being in it for the money is wide of the mark.

>Gee let me think TAPR and AMSAT usually utilize frequencies above 50
>MHZ. Of course they are gonna support something that increases their
>membership whether or not it is good for the hobby. Increasing
>membership is not necessarily a good thing in and of itself anyway.
>Just listen to two meters and 70 cm. They are a disaster around here.
>Jamming and intenonal interference have increased sharply aounrd here.

Accusing TAPR and AMSAT of being in it for the money is even more ludicrous than attacking the League. As to jamming and intentional interference increasing in your area, it appears to be a local personality problem. Certainly we haven't seen it in Atlanta. Of course we don't make a habit of bad mouthing newcomers here, so there's little reason for our repeaters to be targeted by irate folks. We've welcomed the newcomers and helped them integrate into our existing clubs and repeater associations. Many of them have brought an enthusiasm and energy to our groups that was sadly lacking before.

>I supported a no-code "digital" license in the beginning. But now voice
>and who knows what's next. My father has been licensed since 1957 and
>he thinks the no-codes are a joke too. So don't think that because QCWA
>supported it (probably with ARRL's prodding) that "most" hams in the
>hobby for over 25 years agree with you. That is an invalid conclusion.

Hmmm...so your negativism runs in the family. I guess I'm not surprised. Some of our elderly hams were disgruntled at first too, but they were too well mannered to attack the newcomers publicly. Now that no code techs are holding office in clubs, acting as repeater trustees, and generally being the sparkplugs of many of our organizations, most of the elderly, and a few not so elderly, objectors have had a change of

heart.

>Sure incentive licensing makes sense. The idea was put forward to
>increase the number of persons who had a special skill such as Morse
>Code. Anyone can press a mic button and blab.

Anyone can bash a pair of contacts together and make noise too, but
that's not important. It's the *content* of the communications that's
important, not the modulation method.

>Even if code was dropped all together as an exam requirement (can't be
>done because of international agreements) the exmas should at least be
>made worthy of the knowledge an amateur radio operator is suppose to
>posess.

And what knowledge would that be? Amateur radio is supposed to be
a lifelong learning experience. Self training is one of our primary
charters. We don't require a Phd for enrollment in kindergarden,
and neither should we require an engineering degree for entrance
into amateur radio. The idea is to require the minimum amount of
knowledge necessary for the safe and legal practice of radio
experimentation so that the lifelong *learning by doing* can commence.
Any testing beyond that level serves no valid purpose except to
create divisions in the fraternity. Those who wish to use manual
CW modulation will learn how, else they won't be able to use the
method. Forcing them to pass an exam is redundant. The only exam
that's relevant is their communications success or failure *on the air*,
and that doesn't require Federal attention.

As far as international regulations requiring code exams, that misses
the mark a bit as well. First there is no speed requirement in the
international regulations. And second, any national administration
may take exception to any of the requirements simply by filing a
notice of such exception. The Japanese have done so for example.
They allow amateurs who have not passed a code exam access to HF.
It's also almost certain that the next competent WARC will remove
the vestiges of manual International Code testing from the regulations.
Manual code has disappeared from nearly every service except amateur,
and too many national administrations have already established successful
codeless amateur classes. Each country's vote counts as much as any other
country's vote at a WARC. The US won't be able to steamroller an anachonism
on the world forever, even if the League wishes it were so.

To Code or Not To Code, *THAT* is the question! I've collected and distilled the *ENTIRE* net.wisdom on this issue and so I present the following canonical list for your elucidation. In order to conserve net.bandwidth, please search for your favorite answer and then respond by number rather than with the entire text. :-)

Brian McMinn N5PSS brian.mcminn@amd.com

1) No-Code is good!
2) No-Code is bad!
3) Morse Code is a separate and distinct *LANGUAGE*!
4) No it isn't!
5) Yes it is! I just talked to a guy in Upper Eeleeouglieaph yesterday. His name was Dzlaeufliinaout and that's all I know!
6) Everybody should know Morse Code to help intercept *SPY* messages!
7) Hey! Morse is my favorite mode! Don't knock it 'till you try it!
8) Morris Code stinks!
9) No it doesn't!
10) It's the most spectrally *efficient* mode!
11) No it isn't!
12) Code will punch through when all else fails because it has the *BEST* immunity to noise!
13) No way! Digital modes and DSP will pull a signal out of the noise when you can't *EVEN* hear it!
14) I've got better things to do with my brain cells than ask them to act like a wetware modem!
15) I had to learn Morse Code so *YOU* should too!
16) All past and current problems with ham radio are a direct result of the No-Code Technicians!
17) Morse Code keeps the riff-raff out of ham radio!
18) Toss the Code requirement and make the written test harder!
19) Can I order pizza in Morse Code?
20) I heard one of those bozo's sending Morse Code on the repeater!
21) If Morris Code is so good, why does it need protected band space?
22) The FCC says No-Code is good. So There!
23) I wouldn't be a ham if there wasn't a No-Code license.
24) GET A LIFE!
25) Where's my KILL file?
26) That's the sound of an electric hole saw warming up!
27) The ARRL did this to us! Blame *THEM*!
28) The ARRL tried their best to stop this! Blame *THEM*!
29) I'm going to cancel my ARRL membership over this *ONE* issue!
30) Hams who started with No-Code now represent 98% of all hams!
31) Hey! Can't you U.S. guys keep this discussion to yourselves?

32) You're a *#&@!^%!
33) Yeah? And your mother wears tennis shoes!
34) Oh bother, let's just give the spectrum back to the spectrum gods.
35) Vacuum Tubes! Yeah, now that's a great idea!
36) I can build a CW transceiver with only *THREE* components!
37) Including the *ANTENNA*!
38) Without Morse Code, the ham bands will be filled with *CB'ers*!
39) UGH!
40) Hey! Who're you calling a *CB'er*!
41) (in chorus) UGH!
42) Free the airwaves! Eliminate the written test!
43) Sigh. Another step in the &#$*%)# incentive licensing scandal.
44) The QCWA supported No-Code, so it must be good!
45) It's a conspiracy of the {ARRL, QCWA, AMSAT, TAPR, $$$$, etc.}
46) This discussion is *BORING*!
47) *EVERYBODY* supports No-Code!
48) *EVERYBODY* hates No-Code!
49) Morse Code is a *VALUABLE* skill!
50) There's an *INTERNATIONAL AGREEMENT* that forbids this!
51) But Japan doesn't abide by it!
52) Morse Code -- it's *DIVINE*!
53) *FLAMETHROWERS ON HIGH*!
54) Go ahead, I've got my asbestos underwear on!
55) Ya feel lucky, Punk? Huh? Go ahead, make my day.
56) Take this discussion to r.r.a.policy!

> It should only be
> amateur radio operators who are allowed to respond to NPRM's concerning
> amateur radio.

Wrong here as well. This is not how a democracy works.

> I am sure W5YI and the ARRL pushed hard for people to right
> in in a positive way. (This has been convered before).

Actually, the first time it came up the ARRL was against it. The second time they were for it. Can't comment about W5YI, but the ARRL is a membership organization. Doesn't operate too long contrary to the bulk of the membership. I certainly remember much discussion in league circles about this topic.

(By the way, I'm sure ARLL pushed hard for writing, not righting).

> Gee wrong you are there! It was supposed to have been a digital license

What do you base this on? While the digital modes were a reason to relax the licensing requirements, the proposal was for a VHF/UHF license for all modes. There were talks about not making it all the bands, and primarily the reason that it became equivelent to the existing Technician Class license was mostly for administrative than technical reasons.

> Gee maybe you are a no code?

Before you try that on me, I've been licensed since 1970, which puts me right on the threshhold of being an old fart. I have held an Extra Class license since before I started campaigning for a No Code license. I've even been known to work CW once and a while.

It's too bad that there's no way we can administer a test for obnoxiousness. I'd submit the paperwork to add that to the list of requirements today.

The government in the UK cracks down on pirates with an iron fist. The media there (I am told) aren't even allowed to mention pirates exist, and passing information on pirate broadcasts isn't legal. I've seen a program on PBS (from the Beeb) where one of the main characters operated a pirate radio station (briefly) - until agents from the government came along and destroyed his equipment...

Harold, most cell phones use synthesizers with a serial bus tied into a microcontroller. The synthesizers have "magic" numbers just like all other synthesized radios. Take apart the cell phone, replace the uC with a properly programmed uC and bingo, you have a cell phone scanner for base stations. With a little more complexity, you can automatically switch cell sites along with the mobile cell phone in the car next to you. But 99.9% of the stuff on cell phones is not worth the time it takes to listen. It would take me a couple of days to design a cell phone scanner from scratch. I don't do it, not because I would be treading on legal thin ice, but it's just not worth the effort. Besides that, my Alinco DR-570 and DJ-580 will both scan the cell phone frequencies. All the information you ever need on AMPS cellular phones is contained in EIA/TIA-553... Cecil... KG7BK

2210. What am I hearing at 137.5?

Newsgroup: rec.radio.amateur.misc

Cross-posted to: rec.radio.shortwave,rec.radio.amateur.misc

I just recently bought a RS 2006 (due to the
"scare" - but I was going to buy one anyway :-)

I'm hearing something that REALLY sounds like
cordless phones in the range of 137.3 to 137.5. I
scanned the actual frequencies but couldn't locate
a duplicate signal. Since I don't have good technical
specs on the 2006 yet, I wonder if these might be
3 rd harmonics of 49 Mhz cordless (+/- some if
freq?).

This isn't too farfetched since I live in an apartment
complex so well might have several cordless units
within a couple of hundred feet...

THANKS!

>The new law defines a scanner as (among other things) as having coverage
>from 30 mHz to ?? mHz, so cordless phones and public service equipment
>are obviously not included in the ban.

Obvious? There are apparently exceptions made for public service, i.e.
police, ATF, etc. but the definition of scanner was extremely broad:

3. As defined within our rules, scanning receivers, or "scanners,"
are radio receivers that can automatically switch between four
or more frequencies anywhere within the 30-960 MHz band. In...

So many cordless phones can automatically switch between four or more
frequencies anywhere within the 30-960 MHz band. I think the clincher is
the word "anywhere". Switching between four frequencies in the 49 MHz is
certainly included in swictching between four frequencies in the range
30-960 MHz. Makes cordless phones sound like scanners based upon the above
definition.

Was there an exception to cellular phones, or are they too going to be
prohibited? ;-)

My post was intended to advise someone against doing something that's
almost surely illegal, thus saving him a lot of embarrasment and perhaps
a lot of legal trouble. It was not an invitation for smart-ass flamers
to show how much more observant they are. Also, I don't think the fact
that someone's in another country makes him unworthy of a little advice.

>Association must be able to copy.

Unfortunately, even at the standard 35WPM copy, FM voice is still by far a
much better communication method when dealing with mass quantities of
information which must be personally relayed. Of course, there is packet,
but even that has a tendency to get a tad bit trying with multiple
retries and overcrowded packet frequencies.

>This is great. I love it. Join a repeater association in Rhode Island

From: marcbg@feenix.metronet.com
Message-ID: <C6qs5E.8Cx@feenix.metronet.com>
Source record: 281932

Concerning the 800 Mhz band sensitivity problem, SOMEWHERE, SOMEPLACE, I remember seeing a mod for fixing the sensitivity problem with the 741. At the time, I wasn't interested in doing the mod, so I didn't save it. This is not to be confused with the mod to add an extra antenn for 800 MHz.

My 741 works just fine receiving from 420 to about 470 or so, with apparently very good sensitivity. I have R54 and R55 cut and the green wire cut.

If anyone who is following this thread is aware of the 800 MHZ sensitivity mod (repeat, not the seperate 800 MHZ antenna mod) why not share it with the rest of us?

FROM: CA STATE OFFICE OF EMERGENCY SERVICES (W6HIR @ WA6NWE.CA)
2800 Meadowview Rd., Sacramento, CA 95832 (916)262-1600
Landline BBS open to all: (916) 262-1657
RACESBUL.273 DATE: May 10, 1993
SUBJECT: MGT - The committed volunteer - Part 2/3
Just as there are three communications service areas -- administrative, operational, and technical -- there are also varying degrees of activity from one volunteer to the next.
Some people are required to perform on what we will call a CONSTANT basis. A RACES Radio Officer, a CAP communications officer, or a volunteer CD communications officer puts in a lot of yime. He or she does their work at your office, at home, and at their own office. It is not at all unusual for these administrative volunteers to put in 16-30 hours a week.
These same people plus another type of volunteer serve on a SCHEDULED basis. These are the people who are required to serve at a specific time and place on a repetitive and scheduled basis. This might be for weekly radio schedules, paper work at headquarters, training, and other frequently scheduled activities.

(To be concluded in Part 3)

2218. Re: RF "remote control" low power transmitters in the 70cm ham band!

Newsgroup: rec.radio.amateur.misc
Date: 1993-05-09 05:20:25 UTC
From: markz@ssc.com
Message-ID: <1993May09.052025.4402@ssc.com>
Source record: 281938

Robert Casey (wa2ise@netcom.com) wrote:
: On page 55 of the May 93 _RF Design_ magazine, there is a product announce-
: ment for a small transmitter device for remote control applications.
: Operates on 433.92MHz That's in the ham band! Near/in the ATV area?
: Company name is RF Monolithics, Inc, no address goven, just an Info card
: number.

In the USA, this appears to be under Part 15.231. All sorts of fine print, but the gist of it seems that a low power short duration signal can be sent on just about any frequency above 70 MHz (except those on the forbidden list, 15.205). There are two categories of service with different allowed field strengths, depending on how much of the time the signal is transmitted.

Manually initiated signals used for remote control can send 1250 microvolts per meter at 3 meters at 130 Mhz up to 12,500 microvolts/meter at 3 meters on 470 MHz. (Grossly simplified, there is a chart on the actual limits.) Transmissions are limited to 5 seconds.

Automatic transmissions with a duty cycle of less than 1/30th, a transmission length of 1 second or less and, an off period of at least 10 seconds can use 40 percent of the previous levels. (Another chart for this class.)

(Gee, I'd not read this section before. That's pretty obnoxious. About as much as a cordless phone is allowed.)

QST de W1AW
Propagation Forecast Bulletin 18 ARLP018
>From Tad Cook, KT7H
Seattle, WA May 7, 1993
To all radio amateurs

Solar activity has been low and conditions quiet. On May 1 the solar flux went down to 102.6, and is now headed for a modest peak of 125 forecast for this weekend. Geomagnetic conditions have been so stable that we have had several periods over the past week when the Boulder k index was one or lower. The only unstable time was at 1200z on May 3 when the K index reached 4. There is a possibility of some instability over this weekend with an A index around 25.

Following the weekend the flux should meander down toward 115 around the middle of the month, head to 125 around May 21, and then drop back toward 100 near the end of the month.

K8MLV of Pueblo, Colorado sent a comment concerning the statement in ARLP017 that the current solar cycle peaked with flux values of 213.1 in June 1989 and 207.7 in July 1991. These were smoothed monthly solar flux numbers. K8MLV reports that his records of daily flux values show a peak of 327 on June 15, 1989 and 251 on July 5, 1991, and that there was another major peak of 367 on January 30, 1991, and two lesser peaks of 315 on August 26, 1990 and 303 on January 31, 1992. He also reports that the peak in daily solar flux of 367 was the highest since the previous cycle, when it reached 383 on November 10, 1979.

Sunspot numbers from April 29 to May 5 were 60, 51, 41, 42, 55, 91 and 90, with a mean of 61.4. 10.7 cm flux was 106.5, 105.8, 102.6, 103.1, 107.1, 110.6 and 117.9, with a mean of 107.7.

This week'S projection is from Louisiana to Japan. 80 meters should be open from 0930 to 1100Z, peaking around 1030Z. 40 meters should be open from 0900 to 1200Z, peaking around 1000 to 1100Z. 30 meters should open from 0800 to 1300Z, and 20 meters from 0530 to 1500Z, with best conditions most days from 1100 to 1230Z. 17 meters should have moderate openings from 0200 to 0430Z, and on some days from

1200 to 1500Z. 17 meter openings actually should start modestly a few hours before sunset on the Louisiana end, gradually getting better into the evening. 15 meters does not look very good over this path, but on some days there should be some modest openings from 2130 to 2330Z and from 0230 to 0300Z. 12 and 10 meters do not look promising.

NOT! Break out a QST from the early-to-mid 1980's and you see that the ARRL polled its membership, and the membership was staunchly against a "no-code" license. I remember the article, I'll try to have a specific reference for it later today after I speak to our organization's librarian.

I disagree; two reasons:

1. Ham radio is supposed to be a "self-policing" body. Discussion and
comments designed to foster the betterment of the hobby are very
pertinent.
2. There is currently an NPRM in the works, being authored by Tony
KD1NR, to restructure the [V,U]HF privledges of the no-code
technician. Some of the ideas expressed in this discussion are
going to be included as part of the NPRM.

Propagation Forecast Bulletin 18 ARLP018
>From Tad Cook, KT7H
Seattle, WA May 7, 1993
To all radio amateurs

Solar activity has been low and conditions quiet. On May 1 the
January 31, 1992. He also reports that the peak in daily solar flux
of 367 was the highest since the previous cycle, when it reached 383
on November 10, 1979.

Sunspot numbers from April 29 to May 5 were 60, 51, 41, 42, 55, 91
and 90, with a mean of 61.4. 10.7 cm flux was 106.5, 105.8, 102.6,
103.1, 107.1, 110.6 and 117.9, with a mean of 107.7.

This week'S projection is from Louisiana to Japan. 80 meters should
be open from 0930 to 1100Z, peaking around 1030Z. 40 meters should
be open from 0900 to 1200Z, peaking around 1000 to 1100Z. 30 meters
should open from 0800 to 1300Z, and 20 meters from 0530 to 1500Z,
with best conditions most days from 1100 to 1230Z. 17 meters should
have moderate openings from 0200 to 0430Z, and on some days from
1200 to 1500Z. 17 meter openings actually should start modestly a
few hours before sunset on the Louisiana end, gradually getting
better into the evening. 15 meters does not look very good over
this path, but on some days there should be some modest openings
from 2130 to 2330Z and from 0230 to 0300Z. 12 and 10 meters do not
look promising.

>from the past 25 years or so. If you don't own a copy, check your local
>library.
>73,
>Doug K5DH

just in passing - the book had it's name changed sometime around the early 1980's to be called "The ARRL Handbook for Radio Amateurs" for some reason (i recall seeing books called "The Radio Amateur's Handbook" and such appearing in the early 80's by other authors so i guess it was an effort to separate from the crowd at the bookstore - however, many general bookstores don't carry the "ARRL Handbook" in favor of the other books from outfits like Tab or Sams (that always seem to be way behind on the state of the art and have a off beat view of the service in general.))

i think this change occured about the time the paperback edition was discontinued. i'll have to bug Bookstop next time i can get in there about not carrying the ARRL pubs - besides, that's the easiest way to get 10% off the top all the time....8)...especially nice that Bookstop carries the Callbooks.

then again - that's going to be another indicator that amateur radio interest is growing if the non-radio hobby shops are willing to carry books on radio hobbies (humm...maybe the RSGB books too....done on a national basis and with some depth, Bookstop alone could put a dent into sales of these pubs through "traditional" vendors if the sales are static).

No, no, no, NO, NO!

The new "scanner law" defines "scanner" as any radio receiver which can automatically switch between four or more frequencies in the 30MHz to 960MHz band. However, it does *not* deny FCC approval for any such device. Rather, any such device must not be capable of receiving and demodulating signals in the frequency range allocated to the cellular telephone service, and must not be easily modified to receive those signals. Frequency converters that shift the signals in the cellular band to another frequency range are also denied approval.

This does *not* cover cordless phones, since while they can automatically switch between four or more channels in the range 30MHz-960MHz, they don't receive signals in the cellphone bands.

It also doesn't apply to scanners that can receive all of the 800MHz band *except* the cellphone subbands.

What I wonder, though, is whether it covers scanners that can receive cellphone transmissions as a result of side-effects of the receiver design...i.e., the old (2*IF)+freq. trick.

I had that kind of thinking while studying for my No-code this past fall.
People (usually those on 11m) would tell me that 2m is 'dead' after 9pm
each evening. It took me till I received my 2m HT to discover that this
is not true here. In fact 2m jumps with activity between 9pm to about 1
30 am (Central). I like the fact that I can use 1.5 watts of power to
talk through a repeater that is about 23 miles away (which is more than I
can say for 11m).

l> etc. Any information at all would be appreciated. Thanks.

Hi Lyndon....

The person to speak to is Eric Rosenberg, WD3Q. He is responsible for their satellite network (VITASAT) which forms part of their overall communications network, VITACOMM.

Eric's Internet address is: wd3q@amsat.org

Say "Hi" to him from me. We caught up on the phone while he was passing through Australia a few weeks ago, as we are intending putting in a VITA ground station in the not so distant future.

Cheers,

David Tilson, VK3UR

STS-55 Shuttle Amater Radio Experiment (SAREX) Mission Concluded

After 10 days in space, over 160 orbits, and 4.1 million miles of space travel, the Space Shuttle Columbia successfully completed its SAREX mission this week with a landing at Edwards Air Force Base, CA. With over 300 packet contacts and numerous school contacts, the SAREX payload on this mission was kept very busy at times. One of the major highlights of this mission from a SAREX standpoint was the testing of the shuttle bay-mounted 1/4 wave vertical antenna on Orbits #61 and #62. From the ground station signal reports, it was observed that the signals appeared to be 10-12 dB stronger compared with the shuttle window-mounted antenna. This information is being compiled by the SAREX Working Group and is being forwarded to NASA officials. It is hoped that the results of this experiment will provide an incentive to NASA to have an outside shuttle bay-mounted antenna to be included on all SAREX missions. Although the bay-mounted antenna was not expected to be used after its initial test, it did unexpectedly find further use late in the STS-55 mission when a N-connector was pulled loose from the window-mounted antenna. Astronauts quickly obtained permission to reconnect back to the 1/4 wave vertical antenna in the shuttle bay. Again signal comming received by SAREX officials reported that packet signals were "booming" into packet ground stations. The SAREX payload was finally stowed away on 5-MAY-93 around 20:50 UTC after working flawlessly during the 10 day STS-55 mission.

Because of electrical power conservation measures taken during this mission, the SAREX computer was turned off and thus was not recording any telemetry during different portions of this mission. However, the SAREX packet station was kept operational. The SAREX Working Group would very much like to examine this telemetry. If you copied the SAREX telemetry during this mission, the SAREX Working Group would like to receive a floppy disk from you of this telemetry. Please send your STS-55 SAREX telemetry to:

STS-55 Packet Logs
Frank Bauer (KA3HDO)
1804 Hopefield Road
Silver Spring, MD
20905

Please send a IBM PC compatible 3.5" floppy with the SAREX telemetry stored in an ASCII formatted file. For those who made a 2-way contact or heard the SAREX payload, you can receive a QSL card or a SWL card by sending your either card to the following address:

IBM Amateur Radio Club/1993
P.O. Box 1328
Boca Raton, FL
33429-1328

Please include a large self-addressed-stamped-envelope (SASE), 4" x 9.5" and sufficient postage or IRCs with your QSL card. Please indicate on the your if you made a 2-way contact or only heard STS-55 with a "STS-55 2-WAY" or "STS-55 SWL" on the outside of your envelope.

In final note from the SAREX Work Group. The Group is acutely aware that during this mission the astronauts were unable to make as many general 2M FM voice QSOs as they would have wanted. A complete rundown of General QSO (Voice and Packet) operations on the past two SAREX Flights (STS-56 and STS-55) will be provided in next weeks ANS bulletin. In particular, Frank Bauer (KA3HDO), AMSAT's V.P. for Manned Space Programs will address concerns raised by several radio amateurs regarding the apparent lack of general QSO operations on these flights. Please stay tuned.

[The ANS would like to thank Frank Bauer (KA3HDO) for the information which went into this bulletin item.]

PHAS-3D MODE B CLARIFICATION

HR AMSAT NEWS SERVICE BULLETIN 128.02 FROM AMSAT HQ
SILVER SPRING, MD MAY 8, 1993
TO ALL RADIO AMATEURS BT
BID: $ANS-128.02

Joint Statement From AMSAT-DL & AMSAT-NA About Phase-3D Mode B Transponder

The following is a joint statement from AMSAT-DL President Karl Meinzer (DJ4ZC) and AMSAT-NA President Bill Tynan (W3XO) regarding Phase-3D:

"A translated version of Peter Guelzow's (DB2OS) report of a Phase-3D satellite transponder meeting held near Munich on 17-18 April, 1993 has been recently circulating via the various AMSAT media. Unfortunately, as a direct result of the tedious process of translating Peter's notes from German to English, readers of the English text might also construe that transmitter and receiver compliments for Phase-3D are now final. We want to again emphasize this is not the case. The Munich meeting resulted in committments from several individuals for a minimum viable baseline suite of equipment for the Phase-3D satellite. At this time, the transponder listing has NOT been finalized. Locations for additional transmitter and receiver modules, including a place for a 2M downlink transmitter, still remain both in the spacecraft structure as well as in the IF matrix.

"On the other hand, we are becoming increasingly concerned that precious little time remains for construction and delivery of any additional electronic components. The process of integrating our flight model spacecraft must commence, without fail, in July '94. This means the absolute latest time that delivery of qualified electronic components can occur is 1-DEC-94. That's about 600 days from now.

"While we are committed to keeping our options open for various additional transmitter and receiver combinations, we also cannot afford to put the entire project's schedule in jeopardy by waiting indefinitely for qualified builders of additional equipment to step forward. Put another way, the details of the various transmitter and receiver compliments will have to be finalized in the very near future.

"The volunteer efforts of each member of the Phase-3D team are focused on building the best satellite that we can with the resources we have available. We are still confident that once built and launched, Phase-3D will truly be the satellite for ALL amateurs. We remain firmly committed to achieving that goal."

[The AMSAT News Service (ANS) would like to thank Karl Miezer (DJ4ZC) of ANSAT-DL and Bill Tynan (W3XO) from AMSAT-NA for this bulletin item.]

AMSAT OPS NET SCHEDULE

HR AMSAT NEWS SERVICE BULLETIN 128.03 FROM AMSAT HQ
SILVER SPRING, MD MAY 8, 1993
TO ALL RADIO AMATEURS BT
BID: $ANS-128.03

AMSAT Operations Net Schedule

AMSAT Operations Nets are planned for the following times. Mode B Nets are conducted on AO-13 on a downlink frequency of 145.950 MHz and Mode J/L on a downlink of 435.970 MHz.

Date UTC Mode Phs NCS Alt NCS

15-May-93 2030 B 148 WJ9F VE2LVC
23-May-93 0030 B 156 VE2LVC W9ODI
30-May-93 0000 B 62 N7NQM W5IU

Any stations with information on current events would be most welcome. Also, those interested in discussing technical issues or who have questions about any particular aspect of OSCAR statellite operations are encouraged to join the OPS Nets. In the unlikely event that either the Net Control Station (NCS) or the alternate do not call on frequency, any participant is invited to act as the NCS.

****

Slow Scan Television on AO-13

SSTV sessions will be held on Saturdays and Sundays UTC:

Mode J Downlink 435.980 MHz
Mode B after J Downlink 145.960 MHz

OPS NETS will take priority, look for SSTV activity immediately after the net. SSTVer's are invited to join the Net to make schedules at other times if desired.

W6SP SERIOUSLY ILL

HR AMSAT NEWS SERVICE BULLETIN 128.04 FROM AMSAT HQ
SILVER SPRING, MD MAY 8, 1993
TO ALL RADIO AMATEURS BT
BID: $ANS-128.04

Former AMSAT-NA Chairman-Of-The-Board Seriously Ill

Former AMSAT Chairman of the Board, John W. Browning (W6SP) is seriously ill at his California residence. Words of greetings and well-wishes are certainly in order to buoy up this stalwart who gave so much of himself to our hobby.

Many AMSAT members will recall John's steady leadership guiding AMSAT-NA into the Phase-3 era in the Eighties whilst trying (mostly successfully) to coax an unruly herd of prima donna techies (and would-be techies) in the same general direction. Many will also remember his always interesting column, "W6 Space Philosopher" in AMSAT's magazine, "Orbit".

Shot down twice in WWII, a Korean war fighter pilot, and a veteran of more than thirty years in the Air Force, he came to be known as "Colonel Electric" for his many space satellite program achievements including the MILSTAR which he virtually invented. He earned the Distinguished Service Medal upon retirement, an honor usually reserved for senior general officers.

John brought his brand of truly inspired leadership and clear vision to AMSAT at an important transition period where AMSAT-NA became one of a family of significant AMSAT organizations with a need to share program decisions on an international scale. He understood the "new AMSAT realities" long before many did since he had experienced similar scenarios in his work with NATO satellite managers.

Now W6SP is "down for maintenance" and his spirits could certainly benefit from hearing from his many friends in the Amateur Radio community who have benefitted through his contributions and simply through knowing him.

QSLs or letters may be addressed to John at:

John W. Browning (W6SP)
6202 Lochvale Drive
Rancho Palos Verdes, CA, 90274, USA

Or, WA2LQQ would pleased to relay your greeting messages sent to WA2LQQ over UO-22, KO-23 or via the INTERNET: rip@pandora.sf.ca.us

[The AMSAT News Service (ANS) would like to thank Vern Riportella (WA2LQQ) for this bulletin item.]

WEEKLY OSCAR STATUS REPORTS

HR AMSAT NEWS SERVICE BULLETIN 128.05 FROM AMSAT HQ
SILVER SPRING, MD MAY 8, 1993
TO ALL RADIO AMATEURS BT
BID: $ANS-128.05

Weekly OSCAR Status Reports: 08-MAY-93

AO-10: AMSAT-OSCAR-10 is still operational in Mode-B. The telemetry beacon no longer exists. However, despite good signals from the Mode-B transponder, there are very few stations using the transponder. [WD4AHZ]

AO-13: ATTITUDE CHANGE
L QST *** AO-13 TRANSPONDER SCHEDULE *** 1993 May 10 - May 31
Mode-B : MA 0 to MA 130 ! Omnis MA 250 - MA 60
Mode-BS : MA 130 to MA 180 !<- S transponder; B trsp. is ON
Mode-S : MA 180 to MA 190 !<- S transponder; B trsp. is OFF
Mode-LS : MA 190 to MA 195 !<- S beacon + L transponder
Mode-JL : MA 195 to MA 210 ! Bon/Blat 210/0
Mode-B : MA 210 to MA 256 ! Move to attitude 120/0, May 31
Please don't uplink to B, MA 180-190. Interferes with Mode S.
Magnetorquing from attitude 180/0 to 210/0 will commence on 08-MAY-93 [Sat] 20:09 UTC, ORBIT 3752 and will continue for 6 perigees. The new schedule will be uploaded during Mode-L on orbit 3756, so it (only) will contain two Mode J/L/S sessions: MA 130-150 and 190-210. Mode S will be ON for nearly 3 hours, MA 130 to MA 195. New Mode-S stations appear daily. During MA 130-180 you will have to endure the coupling from Mode-B users operating at 145.880 - 145.920 MHz. Either work between them, use as test signals or go X-band. MA 180-190 is Mode-S transponder exclusive (plus Mode-B beacon). MA 190-195 is Mode S beacon (plus Mode-L transponder).
[G3RUH/VK5AGR/DB2OS]

AO-21: The Dual-Hop (DoHop) experiments are planned from AO-21 through the RS-10 bird on 16-MAY-93. Stations wishing to participate should uplink on CW or Lower Side Band (LSB) on AO-21 between 435.100 and 435.110 MHz and call "CQ DoHop de" your call sign. If you are not taking part in the DoHop experiments, you are asked to monitor the RS-10 signals on Mode-A. Signal reports will be appreciated. In your signal reports, please note the time in UTC, frequency, and the location of the station heard. Please send your reports to W2RS @ WA2SNA.#NJ.USA.NA or to G0NKA @ GB7DTX.GBR.EU. [G0NKA]

FO-20: The FO-20 Ground Control Station, JJ1ZUT, announced that FO-20's operational schedule during the month of May will be as follows:

Analog Mode Operation(in UTC):
May 12 11:52 <---> May 13 10:20
May 19 10:20 <---> May 20 10:40
May 26 10:50 <---> May 27 11:08

[JJ1WTK/3]

AO-16: Operating normally and has a number of interesting education files regarding the WO-18 spectrometer experiment. [WH6I]

LO-19: LO-19 is operating normally. The CW beacon is on again. You can copy the CW beacon on a downlink frequency of 437.125 MHZ and it is quite strong. The CW beacon is in operation on Wednesdays only. The beacon output power is near 800 mW and it transmits eight telemetry channels and then its ident-ification. The other PSK transmitter is on a downlink frequency of 437.150 MHz and is used for BBS operations. This week new software has arrived so our software and control team is studying the best way to start to load it inorder to improve the operation of LO-19. If you want like to receive a QSL card from AMSAT-Argentina, please send your telemetry reports to our address:
AMSAT ARGENTINA, P.O. Box 9 Suc. 1, 1401-CAPITAL FEDERAL. [WH6I & LW2DTZ]

UO-22: Operating normally. [WH6I]

KO-23: The BBS has been down for about 48 hours. No digital data output. [WH6I]

The AMSAT NEWS Service (ANS) is looking for volunteers to contribute weekly OSCAR status reports. If you have a favorite OSCAR which you work on a regular basis and would like to contribute to this bulletin, please send your observations to WD0HHU at his CompuServe address of 70524,2272, on INTERNET at wd0hhu@amsat.org, or to his local packet BBS in the Denver, CO area, WD0HHU @ W0LJF.#NECO.CO.USA.NOAM. Also, if you find that the current set of orbital elements are not generating the correct AOS/LOS times at your QTH, PLEASE INCLUDE THAT INFORMATION AS WELL. The information you provide will be of value to all OSCAR enthusiasts.

ARSENE INITIAL KEPLERIAN SET

HR AMSAT NEWS SERVICE BULLETIN 128.06 FROM AMSAT HQ
SILVER SPRING, MD MAY 8, 1993
TO ALL RADIO AMATEURS BT
BID: $ANS-128.06

Initial Keplerian Element Set For ARSENE

According to F6BVP, the ARSENE OSCAR satellite is scheduled to lift-off from the Kourou, French Guiana spaceport on 12-MAY-1993 at 00:51:00 UTC. Based on information given by F6BVP, the following is the initial keplerian element set:

Satellite: ARSENE
Catalog number: 00001
Epoch time: 93132.05451390

Element set: 001
Inclination: 4.9999 deg
RA of node: 227.8710 deg
Eccentricity: 0.7320529
Arg of perigee: 178.0490 deg
Mean anomaly: 40.5970 deg
Mean motion: 2.25970969 rev/day
Decay rate: 0.0e-00 rev/day^2
Epoch rev: 0

This element set will be good until Orbit #6 when at that time, the ARSENE rocket motor will be fired inorder to raise the perigee and to circularize the orbit. At this time there is no AMSAT Launch Information Net (ALINS) net is planned. However, please stay tuned to AMSAT HF/VHF nets for up-to-the-minute information about the status of ARSENE.

[The AMSAT News Service (ANS) would like to thank F6BVP for the information which went into this bulletin item.]

2233. No need to thank me.

Newsgroup: rec.radio.amateur.misc
Date: 1993-05-09 23:46:19 UTC
From: k089118@hobbes.kzoo.edu
Message-ID: <1993May9.234619.20660@hobbes.kzoo.edu>
Source record: 281948

Well, well, well... I thought this boooooring no-code debate should have been over a long time ago. Whatever happened to the amateur service being one big happy family that provided communication during wars, (At least they are doing it right in ex-Yugoslavia.) walked along with parades to make sure medical attention was given to those with cuts and abrasions, and generally made everyone happy? I suggest, nay, demand that all this no-code bickering stop NOW.

As a good ham radio operator, though, I except myself from the newly-imposed rule (Think of all the geniuses on 20M who yell atothers to stop policing a frequency.). Sorry for the digression.

Rick Retzer's plan for the revamping (Can something be 'vamped'?) of the amateur radio licensing structure in the United States:

1. Keep the present novice license the same.

2. Make the technician no-code license test substantially (but not prohibitively) more difficult to pass. This would help ensure that the applicant has sufficient desire to join the elite ranks of amateur radio operators and thus ensure quality control. (Notice no quote marks around quality control. I plan to arrogantly place human beings into categories designated by ME!) As much as we want lots of hams, we don't want lots of idiot hams.

3. Keep the General, Advanced, and Extra licenses, but with only one code level. Something around 10 wpm strikes my fancy. The written tests for these three levels should deal primarily with digital communication. I can understand the need for a basic understanding of electronics, but to be realistic, if someone wants to have a deep understanding of electricity and electronics, he will learn it. I really don't need to understand the inner workings of my HF transceiver. I really don't care how it works, because unless I become an electrical engineer, not gonna be able to fix it when it breaks anyway. I've looked inside it and I'm not touchin' it! The license might be a springboard for for a greater interest in electronics and that is wonderful, but dry impedence formulas should not be shoved down the throats of those who really couldn't care less.

Why require code at speeds faster than 5 wpm when it is not required by international agreement? Come on, 10 wpm is nothing. Morse code is a method of communication that can be learned in a matter of a couple days or less and you're done. All you need to do is listen to it a little bit every day for a week and you will never forget it. It binds the amateur community together through language barriers (Since I doubt a test on basic Spanish, French, or German would go over well in the United States.).

Finally, I have decided that the incentive licensing program is necessary to prevent hams from becoming complacent. Consider this the end of the no-code back-and-forth. Imagine that, I just solved a major problem for the amateur service in my first-ever posting to a newsgroup. You're welcome. Feel free to be impressed.

Rick Retzer, WK0S

Well I don't know if you did that... But I do agree about incentive licensing
in part at least. Has anyone suggested a basic ticket plus endorsements?
This seems like a more realistic reflection of the current amateur
environment. [Apologies if this is resurrecting ancient flame wars.]

You get a "basic license" with no code. If you want HF privs, you get
a NN wpm (you choose) CW endorsement to abide by int'l regs. Maybe a
technical component relating to HF propagation, procedures, etc.

If you want VHF, go for that endorsement. No code, but appropriate
technical component. (Maybe basic = VHF, in which case, no endorsement
needed.)

If you want power over 100 w, get high-power endorsement, showing you
know what problems & procedures of high power are. (dangers, interference
potential, etc.)

If you want to be a DX hound, demonstrate knowledge of and interest in
DX procedures and maybe QSLs from 20 countries, and you get those magic
sub-bands.

If you want digital, ATV, traffic handling, mobile, tower over 30 ft,
etc., we've got the endorsement for you.

I think this builds on hams' natural propensities to go for awards and
stickers and at the same time keeps the rewards clearly proportional and
relevant to the investment to pass the test. (I assume the written
tests would be significantly harder than they are now.)

All that was easy. The hard question is how to rationalize the assignment
of callsigns... hi.

> I'm looking for experiences on the Ramsey amplifier kits...
> How reliable are they (esp. the PA-10) Can they be easily
> converted to other bands (e.g. 10 m)? Are there any other
> companies that I should try?

I haven't tried the high power amps, but I have built two
preamps that work wonders for me. I highly recommend
Ramsey Electronics kits.

Disclaimer -- I know John Ramsey from twenty years ago and
we used to work in FM broadcast radio together.
I visited his company near Rochester, NY, and it's a ham's dream:
two dozen neat people designing circuits, talking with
hams on the phone, counting capacitors into baggies, writing
technical manuals.

At the Dayton Hamfest, I saw a 10 year old kid stop by their booth
and ask how hard it is to assemble a kit. On the side, Ramsey's wife
gave the kid encouragement, a smile, and a free kit. That's where
tomorrow's hams are coming from.

Sure, you'll get better performance from a storebought rig.
But 's the sweetest RF comes from my Heath and Ramsey kits.

2237. 1 xtal synth cb conversion?

Newsgroup: rec.radio.amateur.misc
Date: 1993-05-10 02:40:53 UTC
From: aaa33750@uxa.cso.uiuc.edu
Message-ID: <C6sI45.HBG@news.cso.uiuc.edu>
Source record: 281952

There are a couple of CB's (donations w/other junk) sitting around
at our club. They have the single xtal 10.240MHz synthesizers. Is
anybody familiar with these? What I'm looking for is the xtal
frequency formula to put it in the 10m band with some degree of accuracy
before I spend money to do it by trial and error. I don't care about
channel spacing since that probably will be Fxtal/1024.
Would this formula put me on the money?

Fch1 (26.965?) /10.24 = Fch1'/Fxtal'

I would guess that for Fch1' = 28.3 (I'd make it a little higher :-)
==> Fxtal' = 10.747
and Fch1' = 29 ==> Fxtal' = 11.012

Just a quick check of cheap (microprocessor xtals) suggests
Fxtal = 11 or 11.0592 MHz.

Anybody have any recomendations or info? I'll probably try these
uP xtal's since there isn't an interference problem anymore with
the current sunspots. :-)

Thanks es 73

ewing@yale.edu (Martin Ewing) writes:
>I think this builds on hams' natural propensities to go for awards and
>stickers and at the same time keeps the rewards clearly proportional and
>relevant to the investment to pass the test.

Speak for yourself. I'm a ham, and I have almost no interest in
"awards and stickers", as you put it. I'd much prefer to talk to
someone who's doing something because it's fun and because it's
useful, rather than someone who's doing it so they can get another
sticker or certificate to put on the wall of their shack.

Licensing should ensure that you are competent to operate your
equipment without endangering yourself or others, and without causing
undue annoyance to others. Ham radio shouldn't be some elite
brotherhood with secret handshakes and hidden codewords; it should be
a hobby, just like RC racing/flying or playing with computers.

Let's concentrate on testing people on *useful* knowledge, not arcane
lore used only by members of the SCA. At the same time, we shouldn't
subdivide things too tightly -- I shouldn't have to go out and get a
new license certification just so I can play around with packet or
ATV, any more than I should have to get a new license certification
for NBFM before I can use my HT.

[This is my last VKWI bulletin folks! The position of VK2
Broadcast Coordinator became vacant at the AGM, and for
various reasons I have decided not to make my services
available in this capacity for another year. Dave VK2KFU
and/or I will keep you posted (literally :-) of developments
down here; hopefully, the new B.C., whomever s/he turns out
to be, will make the bulletin available in electronic form.
Thanks for your kind words of support, and hope to talk with
you on air, during the weekends which I'll now have free!

(BTW, there's a distinct possibility of a new special event
station at the end of May or early June, in which I hope to
be involved. Details later)

VK2WI Weekly News Bulletin

for

9th May 1993

THE MAJOR NEWS ITEMS THIS WEEK

Divisional AGM
Space News
Solar Energy Breakthrough
New UHF Repeater
Wombat News

DIVISIONAL NEWS

[Written after a meeting which lasted about 5 1/2 hours. Any
errors or omissions will presumeably corrected by the new
Broadcast Officer (whoever s/he turns out to be) in next week's
bulletin. In the meantime, my apologies for any mistakes, but
it was a fairly arduous meeting. - VK2SKY]

The Divisional AGM took place at Parramatta on Sunday, attended by
about 70 members [rough count] and many interesting items were
discussed, some at great length.

In particular, the issue of the tower at Dural was discussed for about the first two hours of the meeting. It was revealed that certain legal events are in progress, and for the time being, the tower is to be considered "sub judice". The Council has requested that members refrain from commenting on air or on packet. An Extraordinary General Meeting is expected to be called within the next two months, to allow members to discuss the matter with the Division's legal advisors.

A total of 518 valid ballots were cast, and the following were elected as Divisional Councillors for the coming year:

Sandy Brucesmith VK2AD
Roger Harrison VK2ZTB
Roger Henley VK2ZIG/VK2NWH
Julie Kentwell VK2XBR/VK2ISI
Bob Lloyd-Jones VK2YEL
Tim Mills VK2ZTM
Erich Reimann VK2WH
John Robinson VK2XY
Terry Ryeland VK2UX

We wish all the new Councillors the best for the coming year of service to the NSW Division, and our commiserations go to those who were not elected. And, of course, thanks to all of you who took the time to vote.

It's worth noting difficulties which arose when some ballots were set aside because they appeared to be invalid (e.g. apparent duplicate ballots, which later turned out to be the ballot paper and proxy in separate envelopes. This was discovered after all but one of the scrutineers had gone home. Counting by the way finished at about 1:30am) After much discussion from the floor, Peter ruled that these were valid, which led to Bob VK2CAN and Julie VK2XBR 'tying' for the last remaining Concil position. It was eventually decided by drawing the names from a hat. [Julie's hat, as it happens, though it was not considered a significant factor in Julie's selection.] Peter's decision to allow the questionable votes to be deemed valid was a difficult one.

The notified motions and agenda items were as follows:

1. To form a subcommittee to review the policies set in motion by the VK2 Division since the Second World War.

Result: carried

2. To rescind any Divisional policy preventing the weekly news broadcast from being relayed to the Citizens Band.

Result: carried

3. A report on the AGM quorum requirements, which was forward business from the previous AGM was discussed.

Outcome: The meeting decided that no change to the quorum requirements was to be enacted.

4. A report on alternative methods of paying membership fees was discussed.

Outcome: the council is to look into allowing members to pay their membership fees in quarterly installmens

5. A proposal to award life membership to Tim Mills VK2ZTM.

Result: lost. Note that there was considerable discussion about this matter, in that the item had not been presented as a motion, rather a matter for discussion, and thus could not be voted upon. The Chairman ruled that it could, which evoked a motion of dissent from one member. Another member requested that the proposal be decided by "a poll", which was interpreted to mean a secret ballot.

Several articles of the WIA memorandum of association were consulted, e.g. no 18, and it was decided that a 75% majority of the poll was required to grant life membership. That majority was not reached, which led to several angry comments from the floor. [I understand that legal advice is to be sought to clarify whether a 75% majority or a simple majority is required. This figure hinged on the interpretation of the phrase "special resolution" in article 18, in comparison with the same phrase used in article 51.]

6. Proposal for the WIA to accept an offer of an 18m radiotelescope dish from the Parkes Observatory.

Outcome: there was some interest from the floor, and a working group is to be established to examine the costs involved and other matters relating to the dish.

Other business arising:

Peter O'Connell VK2EMU was re-elected as Returning Officer for the coming year, and there was a vote of thanks from the floor for the fine job that Peter did in conducting the ballot, under trying circumstances.

Eric VK2KUR moved a censure motion against the old council, for their choice of Mother's Day for the AGM. This was carried.

Due to the extended length of the AGM, many questions were withdrawn, to be dealt with later by the new council. [I expect we were all getting tired, and many wanted to salvage some of the day to spend with their families. I think I could safely thank everyone on behalf of the Council for the sacrifice they made to attend the meeting. I'm sure that many more bulletins about the AGM will appear before too long. These are the details that I recall; no doubt others will correct and supplement the information I have presented here. VK2SKY]

[As a side note, the position of Broadcast Officer became vacant at the AGM. If you think you can put together this bulletin every

week, please contact the Divisional Council as soon as possible. VK2SKY]

DIVISIONAL MEMBERSHIP PROMOTION PRIZEWINNERS

J.H. Wilmott VK2AJX won the first prize of a Kenwood TM732A mobile transceiver, and N.F. Black VK2TNB won the second prize, a Kenwood TH28A handheld. The prizes were drawn by a representative of Kenwood Electronics Australia (whose name escapes me, I'm afraid). Neither winner was in attendance at the meeting.

REPEATER NEWS

The Blue Mountains Amateur Radio Club is pleased to announce the commissioning of their new 70 cm repeater at Mount Riverview. The site is 270 metres above sea level, and the repeater is running 14 Watts into a 6 element stacked dipole array. The frequency is 439.475 MHz, and the repeater's callsign is VK2RMR.

-- Doug VK2JDR.

SOLAR BREAKTHROUGH

Back in the 1960s, Chief Engineer Scott (of "Star Trek" fame) was fond of saying "ye cannae change the laws of physics!"; it seems however that a team of researchers at the University of NSW may have done just that.

Since the 1950s, it's been though impossible to achieve a solar cell efficiency of more than 20%. However, a team at the Centre for Voltaic Devices and Systems, at the University's School of Electrical Engineering, has managed to squeeze 20.5% out of their new 16-cell solar module.

A report in Wednesday's Sydney Morning Herald, says that the Centre is famous for its innovations in solar technology. In 1983, an experimental cell developed at the Centre achieved an efficiency of 18.5%.

(Thanks to John VK2GJB for bringing that item to our attention.)

SPACE NEWS

The deferred launch of the ARSENE amateur satellite is due to go ahead this week. The launch was delayed when the omni-directional antenna of the ASTRA-1C was accidentally damaged.

Amateurs at the European Space Agency centre at Kourou, French Guyana, have been monitoring the progress of flight preparations during the past week. On Wednesday, the ASTRA satellite was placed on top of ARSENE, and both moved to the upper part of the Ariane launch vehicle.

The launch is now scheduled for the night of Tuesday 11th
May to Wednesday 12th, at 00:52-01:50 UTC, or between
10:52am and 11:50am Australian Eastern Standard Time.

-- KD2BD Space News Bulletin, 3rd May 1993

Finally, a correction to our Space News segment in the VK2WI
bulletin of 25th April; the word "NOT" mysteriously
disappeared from a sentence describing ARSENE's packet
facilities. To set the record straight, the satellite does
NOT have BBS capabilities on board. Thanks to John VK2XGJ
of the Illawarra ARS for bringing that to our attention.

WOMBAT NEWS

[For the benefit of our overseas readers on Usenet, Fidonet,
and elsewhere, it's worth explaining the term "wombat", which
is the local vernacular for an unlicensed operator, or any
person who uses Amateur Radio in ways likely to incur prison
terms or fines.

Any dictionary will tell you that the wombat is a burrowing
marsupial, of the family Vombatidae, a native of Australia
and several Pacific Islands. Wombats have a general reputation
for being fairly friendly, harmless creatures, unlike other
native wildlife such as the Tasmanian Devil, the dingo (sometimes!),
and of course their radio counterparts.

My information is that the term arose some years ago when somebody
asked on a Sydney VHF repeater what the acronym "WIA" stood for
(it stands for the "Wireless Institute of Australia"). The reply
(reportedly from a well-known local pirate who has since gone
straight) was that it stood for the "WOMBAT Institute of Australia".]

Now, from the May 1993 issue of "73" magazine, a little food
for thought for our unlicensed listeners who like to press a
transmit button from time to time...

In California, a formerly licenced Radio Amateur is going
back to jail, for tranmitting illegally on the Amateur
bands. One Richard Burton (not the actor, of course), who
whose Amateur licence WB6JAC was revoked in 1981, was
sentenced to prison recently, after repeatedly transmitting
without a license and using obscene language on-air. Burton
had a history of offences going back more than a decade; he
was found guilty of similar offences in 1984, and sentenced
to four years in prison. This was later reduced to six
months, to be followed by a five-year probationary period,
which ended in 1989. In 1990, apparently not having learned
his lesson, he was again monitored on the 2 meter band and
convicted of operating without a license. This time he was
ordered to undergo therapy.

Burton was again monitored making illegal transmissions last year, and in December, he was convicted on four counts of operating an Amateur Radio station without a license. This was his third conviction. He could received up to two-years in prison and a $10,000 fine, and has also been ordered to undergo psychological counseling and perform 500 hours of community service. He was later quoted as saying "I think I need to get myself another hobby".

FAKE DISTRESS CALLS
As part of a plea bargain arrangement, Jorge Mestre NS3K of Fairfax, Virginia, has surrendered his amateur Extra class license and must dispose of his ham radio equipment within 60 days. Mestre pled guilty to willfully making fabricated distress calls last summer on the 20 metre band, supposedly involved a sinking ship located in the West Indies. Amateur operators notified the Coast Guard and the FCC; the ensuing search and rescue effort cost the Coast Guard more than $100,000. Mestre agreed to make $50,000 in restitution.

The prank distress calls were traced to Mestre using the FCC's long-range direction-finding network, computer analysis of tape recordings, and "signature print" comparison tests on Mestre's equipment, which was later seized on a federal search warrant.

Mestre was due to be sentenced last Friday, and could face six years in prison and a $250,000 fine.

From July, we hope to bring you lots of news of LOCAL operators getting "put away" for similar offences. Possession of unlicensed equipment, and making illegal transmissions, will carry mandatory prison sentences; for some offences, you won't even have to be caught in the act. Articles about the new penalties have appeared in recent issues of "Amateur Radio Action" and "CB Action" magazines.

WICEN NEWS

The Annual Conference is next weekend, at the Goulburn Police Academy; if you wish to attend and have not already contacted Morton VK2DEX, please do so urgently.

On the same weekend is the 1993 Wyong Rally, and David Thorncraft VKK2UDT is still looking for some operators. The exercise is based at the El Largo Motor Inn at The Entrance, with most of the rally centred in and around Wyong. David can be contacted via packet as VK2UDT at VK2EHQ, or by telephone on (043) 25-0302 (home) or (02) 692-4666 (work).

And on what looks like being a popular weekend for WICEN events, there will be a Horse Enduro next Sunday, at Cedar Creek (via Cessnock), and Frank VK2XVJ is the organiser for this event. Frank can be contacted via packet as VK2XVJ at

VK2KLW.

WICEN Sydney South have their regular meeting on 18th May;
and a Disaster Management Course is on the weekend of
22nd-23rd May, for which Barry VK2AAB is taking
applications.

WICEN is always looking for members to provide the community
with communications assistance when required. Write to
WICEN (NSW) Inc, PO Box 123, St Leonards 2065; or come up on
the regular Sydney WICEN net, on Thursday nights at 9.30pm
on repeater 7150.

-- Dave VK2KFU, WICEN (NSW) Publicity Officer

IPS WEEKLY REPORT

Issue no.: 19
Date of issue: 07 May 1993

Date 30 01 02 03 04 05 06
10cm 106 103 103 107 111 118 120
A index 13 06 05 08 04 06 (10 estimated)
T index 101 86 72 74 63 63 58

Summary of activity

Solar activity was very low 30th April to 5th May, and low
on the 6th.

The geomagnetic field at Learmonth (WA) was quiet from the
1st-4th, quiet to unsettled on 30th April and 5th-6th May,
with some brief active periods on the 30th and 6th.

Ionospheric F2 critical frequencies at Sydney were near
normal except for slightly depressed periods on 4th and
6th. Spread F may have degraded F layer communications at
nighttime on the 1st-2nd may.

Forecast for the next week (7 - 13 May)

Solar: Low to moderate.

Geomagnetic: Active to minor storm levels on the 8th and
9th (nothing to do with the AGM! :-),
active periods 10th-11th May

Ionospheric: Degraded HF conditions expected 8th-9th May
with 20 per cent depressions.

-- Courtesy of IPS Radio and Space Services

CLUB NEWS

LIVERPOOL AND DISTRICTS AMATEUR RADIO CLUB will hold its next meeting this Tuesday starting at 7.30pm. The venue is the Lecture Hall of the Scout Camp, Cambridge Avenue, just off Moorebank Avenue, Liverpool. Richard VK2ARS will talk about oscilloscopes and their uses in the Ham Shack. The lecture will include tips on how to get the best from your 'scope, and some projects to improve your equipment. This promises to be a very interesting lecture and demo by a very qualified professional in the field of Electronic Calibration, and an ardent radio builder and home brewer. LADARC invites you to come and enjoy an evening with at the club. Tea and coffee are provided, and visitors are most welcome.

-- Richard VK2SE

A reminder that the next examinations being run by the WAVERLEY AMATEUR RADIO SOCIETY will be held on Saturday, 12th June at Little Bay. Application forms can be obtained from Eric VK2KUR on (02) 337-2909, and applications close on Friday, 28th May.

The next meeting of the Society will be on Wednesday, 2nd June at the Clarrie Martin Community Centre, 61 Newland Street, Bondi Junction. At this meeting, Eric VK2KUR will give a demonstration of a simple way of making printed circuit boards. As always, tea and coffee will be available at the meeting.

-- Eric VK2KUR

BROADCAST ROSTER

Next Sunday morning: Tim VK2ZTM and Steve VK2QZ
Next Sunday evening: Alan VK2XAT and John VK2FRJ

The duty councillor at Amateur Radio House this Wedesday is ???. The Divisional office is open from 11am to 2pm, Monday to Friday, and 7 to 9pm Wednesday nights. The phone is answered from 12 noon to 1pm during the day, and you can leave a message on the answering machine outside those hours.

News highlights are also available on the Divisional voice mailbox on (02) 552-5188, and you can leave a message afterwards if you wish.

Items for inclusion in this bulletin may be sent by mail to Post Office Box 1066, Parramatta 2124; by fax on (02) 633-1525, or by packet radio to "VK2WI at VK2RWI", to reach us by 7pm on the Friday prior to the broadcast.

2246. Re: no-code defense

Newsgroup: rec.radio.amateur.misc
Date: 1993-05-10 10:59:23 UTC
From: n4hy@tang.ccr-p.ida.org
Message-ID: <N4HY.93May10105923@tang.ccr-p.ida.org>
Source record: 281971

>Gee wrong you are there! It was supposed to have been a digital license
>to begin with. But itth enugh whining and bitching they were granted
>voice privs too. You forget that the "whole" world does not have the no
>code license like the US has.

As a co-author of one of the original proposal put forward to the ARRL
that led to the formation of the `Wilson committee' (I am speaking
of the TAPR/AMSAT proposal which was written almost entirely by the
AMSAT board of directors, proposed to the TAPR board and adopted after
a lot of acrimonious debate ;-), I can authoritatively tell you,
you are as full of shit as a Thanksgiving turkey and I wish you would let
this thread drop. You are speaking from continuous ignorance and bias and
your entire posting was just full of historical/factual inaccuracies touted
as facts from on high. Please, get your facts straight about what the
ARRL did as well. The ARRL is a `representative democracy.' You elect
your director and he in turn (theoretically) votes for you. EVERY SINGLE
DIRECTOR that I know of, conducted surveys of the ARRL members in their areas
before casting the vote that put the ARRL on record as supporting the original
no-code proposal to the FCC that really got the ball rolling this last time.
The FCC did not want to create yet another class of license, necessitating a
complete rewrite of their computer software to handle all of this in a time
of tight budgets for them. THE FCC decided to make it simpler than was being
proposed by the ARRL and it was the FCC that wrote the final structure into
existence. They were able to do this without changing their computer software,
only changing definitions as to what the different classes of licence meant.

The technician class is here, it is operational. In my eyes, it is the best
recruiting success that amateur radio has had in years. We will double
our size when I feared death from the aging amateur population of the late
eightie's, in which the mean age was going UP at one year per year. A sure
sign of little youth entering, and of a dying hobby to my mind. If you
really care so much about code, then do something positive like teach ten
no-codes the code and help them upgrade. That is certainly a lot better
than the negativism that you are broadcasting.

2248. How's a Honda Accord w/50W VHF?

Newsgroup: rec.radio.amateur.misc
Date: 1993-05-10 14:19:12 UTC
From: genem@cup.hp.com
Message-ID: <C6tEG0.BLK@cup.hp.com>
Source record: 281961

Hello net land...

I was wondering if anyone had a feel for the amount of RF the Accord could withstand. I am considering the purchase of a (93) Honda Accord and would most likely be putting a thru-the-glass antenna in the rear window and running 50W (max) of VHF & UHF to it (if I could find a place for the rig!).

It does have a in-the-glass defroster back there, but so did my Lebaron and that didn't cause 'too' much trouble :)

I appreciate hearing from anyone who has tried this.

73,
Gene

I just purchased the Heathkit Phone Patch at a fleamarket.

Can someone send me the basic instructions on how to use this
gadget? It looks pretty simple, I just want to make sure.

Thanks in advance,
73,

Any speculation on what these changes might be? I am going for my no-code (ie scumbag) ticket this month and will be buying an HT - so it would be good to know what changes MAY be coming. On the other hand, maybe I'll start studying the code after I get my ticket.

2252. DXing in Guatemala: equipment advice sought

Newsgroup: rec.radio.amateur.misc
Date: 1993-05-10 15:04:29 UTC
From: gj169883@alfred.carleton.ca
Message-ID: <gj169883.737046269@cunews>
Source record: 281968

I will be spending a year in rural Guatemala and am hoping to take a rig down with me to stay in contact with people back in Canada. As I will be in a rural location I will need to be able to use batteries or generators as a power supply; further, I would like to be able to receive general shortwave broadcasts to keep up to date with the news.

As I currently don't know much about DXing I have some questions about the equipment that I will need (for example, will it be better for me to try to be in direct contact with Canada or should I patch into phone lines? Should I be looking into packet technology?); any advice that you can provide will be appreciated.

I use a Kenwood TM-241A 2-m, 50-W rig in my '86 Honda Accord.. Plug it
into the cig lighter and use a Hustler RX-2 mag mount on on the roof.

There are no problems.

Kenwood says don't plug into cig lighter. But I do it anyway. The cig
lighter plug gets warm on 50-W and so does the rig.

2254. My List of Mail Order Electronics Companies

Newsgroup: rec.radio.amateur.misc
Date: 1993-05-10 15:15:29 UTC
From: jfw@ksr.com
Message-ID: <26301@ksr.com>
Source record: 281967
Cross-posted to: sci.electronics,rec.radio.amateur.misc,rec.radio.info

[$Revision: 2.12 $; last updated May 3, 1993]

Here is my list of companies which will sell electronic components in small quantities. Most of these places I have bought from, a couple I haven't. Being a ham radio operator, I am most interested in RF components, and in particular, air variable capacitors, which tend to be scarce (and tend to be used or surplus even if I've otherwise labelled the seller as "NEW"). I apologize in advance for disparaging remarks about what happens when parts suppliers start selling computers, but anyone who has watched Jameco over the years will know just what I mean (though their latest catalog hints at possibly returning to selling parts).

Categories are:
NEW COMPONENTS Distributors and sellers of new components, or "new and some used" in a couple of cases.
SURPLUS ELECTRONICS Usually overstocks, occasionally used equipment. Ideal for stocking the junkbox, usually have dependable stock lines of resistors, capacitors, and some semiconductors, but won't have those LCD modules forever... An invaluable resource, don't shy away from them.
SPECIALTY COMPONENTS In particular, crystals and toroidal cores.
KITS Ham radio kits, random electronic kits, whatever they have.
LITTLE GUYS Separated out because of some twisted sentimentality, I suppose. Intended to honor one or two ham spare-bedroom operations.
PUBLICATIONS Two publications which are essentially all want-ads, plus the address for SAMS PHOTOFACTS because everyone always asks about it on sci.electronics.

Note on shipping costs: I don't always update these frequently enough, and they're generally for continental US unless otherwise mentioned.

NEW COMPONENTS:

Ocean State Electronics
P.O. Box 1458
Westerly RI 02891
(800)-866-6626 (orders)
(401)-596-3080
(401)-596-3590 (FAX)
Minimum $5, S&H $4, free catalog. Wide array of RF parts, especially air variables and B&W coils.

Radiokit (store is located at:)
P.O.Box 973 169 Jeremy Hill Rd.

Pelham NH 03076 Pelham NH 03076
(603) 635-2235
No minimum ($3 service charge if under $20), many kits, lots of J. W. Miller chokes & coils, B&W coils, RF switches, Millen variable capacitors, lots of parts in general. Send $1 for the catalog (but note that they are currently (12-June-92) out of catalogs and it will probably be months before the next one is ready).

Circuit Specialists Inc
P. O. Box 3047
Scottsdale AZ 85271-3047
(800) 528-1417
No minimum with check or money order, $15 otherwise. $3 S&H.
New electronics, good RF assortment, increasing infestation of computers.

Mouser Electronics Mouser Electronics Mouser Electronics
11433 Woodside Ave. 2401 Highway 287 North 12 Emery Ave.
Santee CA 92071 Mansfield TX 76063 Randolf NJ 07869
Mouser Electronics
370 Tomkins Court
Gilroy CA 95020
Catalog Subscriptions: (800) 992-9943 (Continental US only)
Sales & Service: (800) 34-MOUSER (800-346-6873) (US, Puerto R., Canada)
Very complete catalog of brand-new components (though no air variables). Usually quick service, $20 "minimum" ($5 charge under $20). When ordering, you may want to be sure to ask about availability and shipping locations; they have several warehouses, and frequently orders will get sent from several warehouses (which drives up the shipping costs).

Digi-Key
701 Brooks Ave. South
P.O.Box 677
Thief River Falls, MN 56701-0677
1-800-DIGI-KEY
No minimum, $5 handling under $25, free and very complete catalog, very nice indeed. Prices aren't always the best, but rarely excessive. Weak on RF specialty parts (though they now have the ever-popular NE602N), but they do have blue LEDs.

Active Electronics
11 Cummings Park 237 Hymus Blvd
Woburn MA 01801 Pointe Claire, Quebec, H9R 5C7
(800)-677-8899 (US)
(800)-363-6592 (Canada) [Not listed in current catalog, try US number]
$25 minimum, $5 S&H UPS, catalog has a "$10 Suggested retail price" but they sent mine for free. They have 8 stores in the US (Santa Clara CA; Chicago IL; Baltimore MD; Woburn MA; Detroit MI; Mt. Laurel NJ; Long Island NY; Seattle WA) and 10 stores in Canada (Quebec City; Montreal (2); Ottawa; Mississuaga; Winnipeg; Calgary; Toronto; Edmonton; Vancouver BC). Lots of stuff, oriented more toward supplying last-minute requirements of companies than hobbyists, but perfectly happy to take your money in small doses (stores have

no minimum order). The $25 minimum for certain items is no longer explicit, but they note that some items will "ship in factory minimum package quantities", which might be worse.

Maplin Electronics Ltd.,
P.O. Box 3,
Rayleigh,
Essex,
SS6 8LR
U.K.
Phone numbers: your international code +44 702 554161 for sales
+44 702 553935 Fax
+44 702 556001 Tech enquiries(2-4pmGMT)
"Over here [in the United Kingdom] the main hobbyist electronics supplier is Maplin Electronics who stock a wide variety of equipment. They have a catalogue which can be shipped for 10.65 pounds sterling by air or 5.50 pounds sterling by surface mail. They accept Mastercard, American Express and International Reply Coupons. They have at least one type of air-filled variable capacitor!" (Thanks to Kev White at Cambridge University).

Newark Electronics
Send catalog requests to:
Newark Electronics
ATTENTION CATALOG DEPARTMENT
4801 N. Ravenswood Ave.
Chicago IL 60640-4496
(312) 784-5100
They don't have a single mail address or phone; instead, one is supposed to call the closest of three pages worth of branch offices. I don't feel like typing in the entire list (it's copyrighted, anyway :-), so send email for your "local" distributor, or call their administrative offices at the number above. They have a $25 minimum order; they are a Real Distributor, but accept small orders (over the minimum, of course). Their catalog currently 1248 pages; they are very complete (except, of course, for my favorite scarce item, the air-variable capacitor). Note that the catalog prices tend not to match reality all that often, so order by phone rather than by mail; prices tend to be higher than other places, but they have a lot of things that are hard to find from other outlets. Also note that they have six Canadian offices, and one UK office, and will take international orders at 500 N. Pulaski St., Chicago IL 60624-1019, +1-312-784-5100 (FAX +1-312-638-7652, TLX 6718690 NEWARK U).

Arrow Electronics, Inc. Catalog requests to:
Catalog Division Catalog Division
1860 Smithtown Ave. 25 Hub Drive
Ronkonkoma NY 11779 Melville NY 11747-9828
(800) 93-ARROW
Minimum $25; they no longer have a catalog. They are a Real Distributor, but also didn't mind my placing a personal order (a couple of years ago).

MCM Electronics
650 Congress Park Drive
Centerville OH 45459-4072
(800) 543-4330
Minimum $20 ($25 for charge cards, and they don't take personal checks), handling $1.95 + shipping. Oriented toward repair technicians, really heavy on VCR parts and somewhat overpriced doodads, lots of useful stuff not easily found elsewhere.

Fordham Radio Supply
260 Motor Parkway
Hauppauge NY 11788-5134
(800)695-4848
Tools for technicians. One or two items are not outrageously overpriced.

Jameco
1355 Shoreway Road
Belmost CA 94002
(800) 831-4242
(800) 237-6948 (FAX)
(415) 592-8097
$30 minimum order (was $50), >$5 shipping & handling. Their most recent catalog may have reversed a long trend of abandoning parts in favor of PC compatibles, or it may not; one can always hope.

JDR Microdevices
2233 Branham Lane
San Jose CA 95124
Orders: 800-538-5000
Cust. Service: 800-538-5001
No minimum, $5+ shipping. Mostly computers now, but they haven't yet decided to abandon components; indeed, they recently dropped their minimum order requirement entirely.

Johnson Shop Products
P.O.Box 160113
Cupertino CA 95016
(408)257-8614 (408)996-3240
Catalog $1. No minimum. Shipping charge is based on UPS; very small orders that can be sensibly shipped in a first-class letter, include money for first-class postage. New and some used electronic parts.

DC Electronics
P. O. Box 3203
Scottsdale AZ 85271-3203
(800) 423-0070 (orders)
(602) 945-7736 (stock/price checks)
$15 minimum charge order, no minimum for checks, $3 min. shipping&handling.
Wide array of ICs, good assortment of electronic components.

EasyTech Inc
2917 Bayview Drive
Fremont CA 94538-9932

(800) 582-4044 (orders)
(510) 770-2345 (customer Service)
Apparently a brand new company, "dedicated to serving the Electronic
Enthusiast/User." $10 minimum, UPS shipping is 5% of order (>= $3).

International Components Corporation
1803 NW Lincoln Way
Toledo OR 97391-1014
(800)325-0101 (US & Canada)
(503) 336-4400 (FAX)
Cabinets&Enclosures; Capacitors; Diodes; ICs; Potentiometers; Resistors;
Sockets; Transistors; Books. No minimum order, $2 handling under $25.

Kelvin Electronics
7 Fairchild Ave.
Plainview NY 11803
(800) 645-9212
(516) 349-7620
(516) 349-7830 (FAX)
Minimum order $20; S&H 5% of order ($5 minimum, extra for large stuff,
overnight, export (like to Hawaii :-), and etchant; based on UPS charges).
Lots of electronic parts & tools, some robotics supplies, model rockets.

H & R Company (Herbach and Rademan)
18 Canal Street, P.O.Box 122
Bristol PA 19007-0122
(800) 848-8001 (Orders)
(215) 788-5583
(215) 788-9577 (FAX)
Minimum order $25 ($5 processing charge under $25), shipping $4.75 under $30;
Most items are new overstocks, much regularly stocked stuff as well. Tools,
electrical supplies, motors, mechanical components, robotic components.

SURPLUS ELECTRONICS:

All Electronics Corp.
P. O. Box 567
Van Nuys CA 91408-0567
(800) 826-5432
$10 minimum, $3.50 S&H. New and surplus electronics.

Alltronics
2300 Zanker Road
San Jose CA 95131
(408) 943-9773
(408) 943-9776 FAX
Surplus electronics. $12 minimum, shipping per UPS.

American Science and Surplus (formerly JerryCo)
P.O. Box 48838
Niles IL 60714-0838 ### New address.
(708) 475-8440

(708) 864-1589 FAX
Surplus. *The* surplus place. Lots and lots of surplus. WWII gun cameras, velcro, laser disk chassis, 6 volt VW wipers motors, LEDs, rubber brains, you name it, they've had it. Catalogs are a really good time.
$12.50 minimum order (which includes the $4 shipping charge).

BCD Electro
P. O. Box 450207
Garland TX 75045-0207
(214) 343-1770
$1 for 1-year subscription to catalogs, no minimum, $0.95 for under $30, $2.90 shipping (extra for Alaska & Hawaii). Surplus electronics, pretty random looking assortment.

Fair Radio Sales
P. O. Box 1105
1016 E Eureka St.
Lima OH 45802
(419) 227-6573
Surplus electronics. Heavy on parts for old Collins gear.

Hosfelt Electronics
2700 Sunset Blvd.
Steubenville OH 43952
(800) 524-6464
No minimum, $3.75 S&H. Surplus electronics.

HSC Electronic Supply (Halted Specialties Co.)
3500 Ryder Street
Santa Clara, CA 95051
(800) 4-HALTED Orders only
(408) 732-1573 inside California and outside US
Surplus (new) electronics; new and used test equipment. Minimum order $10 ($2 handling charge under $20), plus UPS shipping cost. Has three stores, of which 3500 Ryder Street is one.

Marlin P. Jones & Assoc.
P.O. Box 12685
Lake Park FL 33403-0685
(407) 848-8236
No minimum ($1 fee for under $10), shipping per UPS. Surplus electronics.

R&D Electronics
1224 Prospect Ave.
Cleveland OH 44115
orders: (800) 642-1123 (tues - fri 9am-4pm sat. 9am-3pm EST)
info: (216) 621-1121
$10 minimum. Surplus electronics.
"Also known to stock many components, but this is not discussed in the catalog. Local store, a cleveland institution, is called Electronic Surplus, Inc., and has been there since '48. Third generation now runs it." -- wb8foz

Surplus Sales of Nebraska
1502 Jones Street
Omaha, Nebraska 68102
(402) 346-4750
(402) 346-2939 (FAX)
New and surplus radio electronics. Wide selection: air variables.
Catalog $3 (free with order, refundable with $25 catalog purchase).

Tucker Surplus Store
1717 Reserve St.
Garland TX 75042
(800) 527-4642 extension 135
Surplus electronic gear; oscilloscopes and signal generators from the days when dinosaurs with vacuum tubes roamed the earth (some solid state gear, but all well used). Prices seem relatively high, and you'll be shocked to learn how much it costs to ship a 75 pound oscilloscope by motor freight...
[Steve Brown, N8HFI:
In defense of Tucker, the have a broad selection, repair facilities, and they certify the used equipment to meet the original specification and warranty it for 90 days. Not every source does this:]

Davilyn Corp.
13406 Saticoy St.
North Hollywood, CA 91605-3475
1-800-235-6222 (Ex. CA)
1-818-787-3334 (CA)
1-818-787-4732 (FAX)
Surplus electronic gear.
[has much better prices [than Tucker], but sells used equipment as-is. -N8HFI]

SPECIALTY COMPONENTS:

JAN Crystals
2341 Crystal Drive
P.O. Box 06017
Fort Myers FL 33906-6017
(800) JAN-XTAL (Monday through Thursday)
They make crystals. Minimum order is $10, which might be one crystal, or might be two.

Crystek Corporation
2351/2371 Crystal Drive
P.O. Box 06135
Fort Myers FL 33906-6135
(800) 237-3061 (M-F)
They make crystals too. They were the cheapest last time I ordered, but I don't have an up-to-date price list. It took about 4 weeks, and they had said it would take 6.

ICM (International Crystal Manufacturing Co., Inc.)
701 W. Sheridan
PO Box 26330
Oklahoma City OK 73126-0330

(800) 426-9825
More crystals. They were more expensive, but they have lots of pre-made crystals for various rigs, so they would probably be faster.

Amidon Associates
2216 East Gladwick Street
Dominiguez Hills, CA 90220
(213) 763-5770
(213) 763-2250 (FAX)
Toroid cores and related things. Very fast service. Now takes MC/Visa and phone orders.

Palomar Engineers
Box 455
Escondido CA 92033
(619) 747-3343
Toroid cores and shielding beads.

K2AW's Silicon Alley
175 Friends Lane
Westbury NY 11590
516-334-7024
Free catalog, $10 minimum order. Semiconductors, in particular high-voltage diodes.

Small Parts, Inc. [New address and phone, 23 Dec 91]
13980 NW 58th Court
P.O. Box 4650
Miami Lakes, FL 33014-0650
(305) 557-8222 Order department
(305) 557-7955 Customer Service (ask for Mirta)
(305) 558-1255 Catalog (ask for Elizabeth)
(305) 557-8004 Custom-made Parts (ask for Ziggy)
(305) 557-8005 Non-standard Sizes
of catalog parts (ask for Eric)
(800) 423-9009 Toll free FAX line
$12 minimum. Mechanical parts, metal stock, Teflon(R) sheets, tools, wire-size drill bits (as in #61 size for PC board holes).

KITS:
(The terse "Note:" descriptions are from the ARRL Kit List courteously supplied by Ed Hare and Mike Gruber at the ARRL.)

624 Kits
171 Springlake Drive
Spartanburg SC 29302
QRP kits (including some designs from W1FB's books) and some parts.

A&A Engineering
2521 W. LaPalma, Unit K
Anaheim CA 92801
(714) 952-2114

Kits, some components, some books. S&H $4.50, catalog is free with SASE (2 oz postage).

Antique Electronic Supply
6221 S. Maple Ave.
Tempe, AZ 85283
(602) 820-5411
Note: Broadcast receiver kits

Circuit Board Specialists
P. O. Box 951
Pueblo CO 81002
(303) 542-4525
As the name implies, they specialize in circuit boards; they have circuit boards for a variety of QST articles and ARRL Handbook construction articles. They also have partial kits for most of their boards. The catalog is free, but I had to request it a couple of times.

C.M. Howes Communications
Eydon, Daventry,
Northants NN11 6PT
England
Phone: +44 327 60178
QRP, transmitters, receivers, misc. "The Heathkit of England", though with assembly manuals not as detailed, also without the intricate mechanicals of Heathkits.
[Carried by Townsend Electronics (at least) in the US]

Communications Concepts Inc.
121 Brown Street
Dayton, Ohio 45402
(513) 220-9677
kits for Motorola Applications Notes (amplifiers and the like), small assortment of components (chip capacitors, transistors).

Down East Microwave
Box 2310, RR#1
Troy, ME 04987
(207) 948-3741
Note: Microwave preamps

FAR Circuits
18N640 Field Court
Dundee IL 60118
Printed circuit boards for articles in the usual ham magazines. SASE for list. $1.50 shipping and handling per four boards.

Hamtronics, Inc.
65 Moul Road
Hilton, NY 14468-9535
(716) 392-9430
Note: Amateur, general interest

John Langner WB2OSZ
115 Stedman St.
Chelmsford, MA 01824-1823
(508) 256 6907
Slow Scan Television for IBM PC.

Lake Electronics
7 Middleton Close
Nuthall
Nottingham NG16 1BX
England
Note: Amateur

Mercury Systems
15 Lakeside Dr.
Marlton, NJ 08053
1-609-596-3304
Note: the ARRL Kit list didn't say what they carry; I don't (yet) know
either.

Penntek Electronics
14 Peace Dr.
Lewistown, PA 17044
(717) 248-2507
Note: The Neophyte Receiver, QST

Ramsey Electronics
793 Canning Parkway
Victor NY 14564
(716) 924-4560
Amateur radio and hobby kits. The ham kits are all pretty simple and
pretty inexpensive, and you get about what you pay for. Their new
VHF transceiver kits (144, 220, 440) look pretty interesting. Many have
complained about the quality of their kits, though.

Townsend Electronics, Inc.
Box 415
133 N. 1st Street
Pierceton IN 46562
(800) 944-3661 (US only)
(219) 594-3661
(219) 594-5580 (FAX)
C. M. Howes Communications kits. Radio mounts. RSGB and ARRL publications.
$1 for catalog. $4 shipping & handling.

{See also RadioKit, Oak Hills Research}

LITTLE GUYS:

Oak Hills Research
20879 Madison St.
Big Rapids, MI 49307
Send $1 for a flyer. Some parts, QST article kits, transceiver kits,
QRP stuff in general (they inherited the stock from Small Parts Center

when they closed).

KA7QJY Components
Danny Stevig
Box 3893
Logan UT 84321
(801) 753 5961
Send a business-size SASE for a current list of parts. RF parts, including vernier drives and air variables. $2.75 shipping, no minimum. Fast service, lots of satisfied customers.

R&R Associates
3106 Glendon Avenue
Los Angeles, CA 90034
(213) 474-1315 (res)
[Richard Rathburn, KB6NQ] "I mainly sell pc boards from QST, Radio Electronics, etc., and a few of in-house design. I also sell IC's, etc." Send a SASE every now and then for his most recent flyer. He also has boards for some Motorola Application Notes.

MANUALS:
Eico Electronic Instruments Co., Inc.
363 Merrick Rd
Lynbrook NY 11563
Note: No current kits, EICO manuals and schematics only

2255. G5RV: How does it work and perform?

Newsgroup: rec.radio.amateur.misc
Date: 1993-05-10 15:16:26 UTC
From: hayssen@sceng.UB.COM
Message-ID: <9304107370.AA737043386@sceng.UB.com>
Source record: 281962

I know a G5RV is a multi-band dipole-like antenna but that is about all I know about it. I have seen other interesting discussions about antennas here. I'd like to see one on the G5RV. What bands does it cover for what lengths of wire? (obviously one could scale it) How does it work theoretically? How well does it work practically? Are there good ones and bad ones? What does it take to make a good one? How does it compare to a trapped dipole?

I just got Hf privleges (in one easy test) and want to try out the HF bands relatively cheaply. I have a borrowed HF transceiver but need some reasonable antennna for it. The wire hanging out my window receives ok but the tuner doesn't like it much.

If you "scale" it, it ceases to ba a G5RV antenna. Please refer to the ARRL Antenna compendium or the ARRL Antenna Manual for a discussion of the G5RV.

> How
> does it work theoretically?

How it works theoretically doesn't seem very important, but see the Compendium article. (Shoot, I'll send you a Xerox of it. Please e-mail me your address in case it's not in the CB yet.)

> How well does it work practically? Are
> there good ones and bad ones?

The only difference I've ever heard is the use of a CHOKE balun where the coax meets the parallel wire line. DONB'T use any other kind of balun here, (It seems like a ferrite bead balun wud be okay.)

Carl;

After the great G5RV controversy a while back, I began asking all who use one whether or not the use a "tuner" or not. ALL replies were YES. (If you don't use a "tuner" then I didn't ask you.)

This very popular and effective wire antenna will do a good job. But why not run the parallel wire line on into the shack and forget the coaxial section? You'll have as good a system and less (a little) loss in the feedline. Mine is 135 feet long so on 40 meters it's a full wave. Gives about 1.5 dB or so gain over a halfewave dipole.

On 160 m you can tie the two conductors of the feedline together and use it as a Marconi antenna. Not great but it works.

>
>How is all this done? Can these things be unlocked just from the number
>pad or is more involved? Do cell phones already have a computer interface
>built-in or did these guys have to invent one?

I was part of the group that testified at this hearing. We showed that certain
varieties of cellular phones have routines built into their ROM code which
allow scanning and performing other functions not listed in any manual. This
was in the context of "nothing you say over this device should be considered secure".
And that "mandating a device as being illegal does not prevent creative persons
from discovering a new use or mechanism in other devices which may perform
the same function".

The Congressmen got the message loud and clear. Definitely a 5-9 UR SIG. THe
very first conversation which we locked on to was most impressive.

Before you ask for it, no we won't send out the "how to" information on this. We
had to get immunity just to testify ! Suffice to say that anyone who writes
their own cellular phone microprocessor assembler/disassembler as was done
in this case can figure it out in short order.

However, the question now becomes one of, if every cellular phone is a scanner and
scanners are illegal, should someone seek an injunction preventing manufacturers
from constructing these devices ? ie, An injunction against Motorola, OKI, etc ?
After all, they are technically in violation of Federal law.

We really believe that the Telecommunications Subcommittee members now see the problems with their previous legislation. We urged them to consider the fact that the value of protected information in a device is directly proportional to how much effort one would spend breaking into it, let's not repeat the cellular NAM problem in the next generation of devices, be they phones, computers or televisions. We showed HDTV, ISDN data and Voice, IP Multicasted Audio and Video conferencing over the Internet, ATM video/audio, to get the message across about the coming era in communications and the flexibility of these devices. What's a phone, a radio, a computer ? They all can do any of the above.

This all has implications with respect to encryption (the current Clipper proposal), authentication and such for future devices, be they for commercial or amateur radio devices. That's what behind it all.

2261. CFV: rec.radio.amateur reorganization

Newsgroup: rec.radio.amateur.misc
Date: 1993-05-10 15:45:16 UTC
From: ikluft@uts.amdahl.com
Message-ID: <rec.radio.amateur-reorg-CFV1@uunet.uu.net>
Source record: 281977
Cross-posted to:
news.announce.newgroups,news.groups,rec.radio.amateur.misc,rec.radio.amateur.packet,rec.radio.amateur.policy,rec.radio.info

```
CALL FOR VOTES
REC.RADIO.AMATEUR REORGANIZATION

This is an official Call for Votes for the reorganization of the
rec.radio.amateur hierarchy of newsgroups. This vote will be conducted
according to the official newsgroup creation procedures, which are posted
regularly in news.groups.

Votes may be cast only with the simple fill-in-the-blanks form which appears
in the "HOW TO CAST YOUR VOTE" section later in this CFV.

SUBJECT OF VOTE
---------------
All of the newsgroups proposed below are UNMODERATED.

rec.radio.amateur.digital.misc
amateur packet radio, RTTY, AMTOR, Clover and other digital amateur
radio modes (This replaces rec.radio.amateur.packet and adds other
digital modes to the subject)

rec.radio.amateur.digital.tcp-ip
TCP/IP via amateur packet radio

rec.radio.amateur.dx
DX (long distance) amateur radio communications

rec.radio.amateur.antenna
amateur radio antennas: theory, techniques and construction

rec.radio.amateur.equipment
amateur radio equipment: manufactured products and modifications

rec.radio.amateur.instruction
amateur radio instruction & examination

rec.radio.amateur.operating
amateur radio operating procedures and techniques

rec.radio.amateur.homebrew
amateur radio construction & experimentation

rec.radio.amateur.space
amateur radio in space: amateur radio satellites, earth-moon-earth
(EME) communications, space shuttle, MIR space station, etc.
```

rec.radio.amateur.emerg-services
emergency services: RACES, ARES, NTS, and other use of amateur radio
in emergencies or disasters

rec.radio.amateur.rdf
radio direction finding: recreational hunts and searches for
interference

Two existing newsgroups will not be affected by this vote. They are
rec.radio.amateur.misc and rec.radio.amateur.policy. They do not appear on
the voting form and no changes resulting from this procedure will apply to
them. rec.radio.amateur.digital.misc will replace rec.radio.amateur.packet if
it passes, otherwise rec.radio.amateur.packet will remain unchanged.

DURATION OF VOTE

Voting will commence when this CFV is posted. It will continue until
9 June 1993 at 23:59PM UTC.

Voting procedures are detailed in the next section, "HOW TO CAST YOUR VOTE."

Upon completion of the voting period, the results will be posted to
news.announce.newgroups, news.groups, rec.radio.info and all the current
rec.radio.amateur.* newsgroups. In order to pass, newsgroups must have at
least a 2/3 majority of YES votes and at least 100 more YES than NO votes.

HOW TO CAST YOUR VOTE

Jay Maynard, K5ZC, is serving as vote-taker for this vote. Please REPLY to
this message via MAIL to his account, jmaynard@oac.hsc.uth.tmc.edu; using your
newsreader's "mail a reply" command on this message should work. Posted votes
can not be counted. You will receive a reply within a few days after your
votes are received which indicates how the vote counting software thinks you
voted - please mail corrections immediately.

PLEASE USE THE FORM AS IT IS.

Please do not delete anything between the "-=-=-=-=-" lines - and most
certainly do not monkey with the group names. Votes will be tallied by an
automatic program and if it can't determine your vote you will be asked to
re-vote.

For each group that you wish to vote on, simply add your vote in the
appropriate space on the same line. Recognized votes are Yes, No, For, and
Against. Yes and For are equivalent, as are No and Against. Capitalization is
not important. If you want to abstain from voting on a particular group, just
leave the space blank. Don't worry about spacing of the columns or any quote
characters ">" that your reply inserts.

You may _NOT_ do a combined vote - i.e., "I vote for all of them" or "I vote
against all of them." Please use the form.

You may only vote once, regardless of how many accounts you may have.
Forwarded or proxy votes are invalid.

>How does it compare to a trapped dipole?

The G5RV generally comes in two versions, 102 feet with a 34 foot ladder line matching section and 51 feet with a 17 foot ladder line matching section. The 102 foot version will cover 10-80 meters (no 30 meters) and the 51 foot version will cover 10-40 meters. The G5RV works really well on 20 through 80 meters but is below average at best on 10 and 15 meters. I can load mine up on 15 meters pretty easily but the best I can do on 10 meters is 3:1. I have heard that you need at least 56 feet of coax running to the ladder line to get it to load up well on 10 meters and as I have only about 35 feet this is probably true. It doesn't really pull in signals all that great on 10 and 15 so if you want to primarly work those bands you might want to try something else. I have seen other versions of the G5RV use a balun where the ladder line meets the coax and I am not sure how well that works. The original G5RV didn't use a balun and I don't use one either. I do cause TVI to my neighbor on 15 meters and on 10 meters. As the SWR is probably pretty high on those bands it is not too suprising. Also you can load up 10 to 80 meters version on 160 by tying the center conductor to the sheild and working it like a random wire on your tuner. Also can load up the 10-40 meter version on 80 doing the same. I do this at times and it works pretty well. All and all I am happy` with my G5RV and would buy one again. Not sure how well it would work versus a trapped dipole. Hope this helps!

2263. Re: no-code defense

Newsgroup: rec.radio.amateur.misc
Date: 1993-05-10 16:04:50 UTC
From: laurahal@microsoft.com
Message-ID: <1993May10.160450.26223@microsoft.com>
Source record: 281842

I favor a no-code entry to ham radio, and favor it very strongly. Mainly because we need new blood, and if changing the rules makes ham radio more accessible to others, then so be it. I've posted before about the relatively low profile of our hobby; if we don't get new blood, our hobby could die out, with our valuable frequencies given to commercial interests. 220 is still intact in Canada, but there is pressure to carve it up, just like what happened in the U.S.

I don't buy the argument that no-code license holders are a bunch of CBers, or that passing a code test somehow makes you a better ham. Listen to 20m any Sunday afternoon: I assume the lids discussing business and using profanity passed a code test to get on. Sure there are folks who use 2m for ragchewing, but so what? How is this different from using 20m for the same thing?

Here is the first round of results of my used HF rig price
survey. I welcome more responses. I would like to know:

- Make, model, and age of your used HF rig that you bought
or sold in the past 3 years.
- Bought or sold?
- Price?
- How bought/sold? (on air contact, private sale, retailer, Usenet,
Yellow Sheet, Hamfest, other ...?)
- Extras? (CW filters, power supplies, etc.)

Send to randall@informix.com or uunet!pyramid!infmx!randall.

I have absolutely no affiliation with any ham-radio-related
business.

2267. Re: G5RV: How does it work and perform?

Newsgroup: rec.radio.amateur.misc
Date: 1993-05-10 16:26:44 UTC
From: markm@bigfoot.sps.mot.com
Message-ID: <1993May10.162644.21056@newsgate.sps.mot.com>
Source record: 281832

Congratulations on the upgrade.

The real G5RV was designed for 20M and it wll work pretty well there if it's constructed carefully. On other bands it's really a compromise. If you have a tube-type radio you can probably use a G5RV because the tube type rigs tend to be more tolerable of high (>1.5:1) than most of the solid state rigs. Many of the so-called G5RV antennas really aren't G5RVs. The original G5RV design is a dipole 51 ft on a side fed with a half wave (on 20M) matching section of twinlead (ladder line is best). The rig end of the matching section is fed with 50 ohm coax with no balun. The length of the coax section should be at least 66 ft (I think...don't remember exactly). Supposedly, it will give a < 2:1 swr on 40 thru 10M without a tuner.

Lots of dipoles that are called G5RVs are actually double Zepps...dipoles fed with ladder line and a tuner. Zepps work well and are easy and cheap to build. You can use just about any wire and even use cheap 300ohm TV twinlead as a feedline, although real ladder line is better. If you already have a tuner, I'd go with the Zepp. Make it as long and as high as you can and you'll be pleased with how it works. Or, put up a coax-fed dipole cut for a specific band. Coax is easier to bring into the house than twinlead but it's more expensive.

Get a copy of the Handbook or the Antenna Handbook for more info. A decent wire antenna is cheap and easy and they work reasonably well, depending on their environment (mainly how high they are).

2268. Old tubes for sale... Check it out!

Newsgroup: rec.radio.amateur.misc
Date: 1993-05-10 16:30:57 UTC
From: slmdj@cc.usu.edu
Message-ID: <1993May10.103057.67558@cc.usu.edu>
Source record: 281529
Cross-posted to: sci.electronics,rec.radio.amateur.misc,rec.radio.swap

Our local Civil Air Patrol squadron has come across a bunch of old tubes, and I got nominated for the honors of selling them. All profits will go to the Cache Valley Composite Squadron, for the purpose of building an aircraft hangar...

I will accept bids through 12 noon MDT on 17 May, 1993. The highest bidder will be notified shortly after to arrange shipping and payment methods. Bids should _NOT_ include the cost of shipping, as that will be figured after, and will depend on the method of shipping, and to some extent, the number of tubes you want. Once received by you, all sales will be final, but all tubes should be in good working order, as we sorted through them and removed any with problems (there were only two...)

You may bid for any number of tubes, but larger quantities are preferred. Send your bid, along with the number listed and your return e-mail address to me:

Paul Cowley
slmdj@cc.usu.edu

This list is roughly sorted by envelope size, and the final section of the list contains some that are known to be transmitting type tubes...

All tubes have glass envelopes...

>> Re Alinco DR570 & DJ580...
>> It just depends on whether you want an HT or a mobile.
>could you clarify for me which is the hT and which the mobile and what are
>the exact frequencies of the mobile over the HT
>
>Thanx.. i appreciate..
>Evan

Evan, the advertised coverage for the mobile Alinco DR570 is:
130-169.995, 440-449.995

after unlocking, the following frequencies can be selected on the DR570:
130-170, 335-375, 420-470, 850-890 all FM

the advertised coverage for the the HT Alinco DJ580 is:
130-173.995, 420-479.995

after unlocking, the following frequencies can be selected on the DJ580:
108-143 AM, 130-174 FM, 400-520 FM, 810-999 FM, but the PLL will not
lock on all the frequencies on my particular unit. I'm sure it varies
unit to unit. I suspect the uhf PLL locks over at least a 120 MHz range
but not over a 190 MHz range.

2270. Cuba & QSLs

I agree, that article is the best, concise explanation of the functioning of the G5RV that I've read. I've come to the conclusion that if you're going to fool with a tuner anyway dimensioning the antenna doesn't make that much of a difference. Put up whats easy and efficient for what you want to do, run a feedline to the transmatch in a way thats easiest keeping efficiency in mind and make qsos.

>TNX es 73 de N1MWY/AE

I have a G5RV. It's a commercially available one, about 110 feet long.
I have it suspended between two trees with the ends of the G5RV about
20 feet from each tree. The wire is about 45 feet above the ground, and
the feed (the twinlead part and balun) drops down to my roof and the last
7 feet and balun are at a right angle to the rest of the feed.

I consistantly get good reports on 80m, 40m and I have worked Europe and
Japan on 20m and higher.

I have a friend who also runs an RV. His is around 30 feet up and bends
around so it is not 110 feet of straight run. He also gets good reports
on the bands it was designed for.

We are both using a tuner.

If you can get it up high enough, it is a good antenna for under a $100.

I have had problems with the twinlead breaking at the insulator due to the
wind flexing the twinlead. I soldered some copperweld to the twinlead and
used this to attach the twinlead to the horizontal wire. This made the
twinlead/long wire junction much stiffer and I haven't had any breaking since,
and we've had some nasty wind recently.

I'm satisfied with my $70 investment,
Galen Watts, KF0YJ

I'm using a G5RV (about 40 feet high) and if I switch between it and
the Mosely TA-33 I notice very little difference. I problems with
high SWR on some bands but my Kenwood TS440 can load into it using the
automatic antenna tunner. The SWR problem, I think, is caused by the
extra length of coax that I added in order to reach the shack.

2275. ICOM 02AT Mic/Speaker Plugs specs.

Newsgroup: rec.radio.amateur.misc
Date: 1993-05-10 17:54:58 UTC
From: black@cherokee.nsuok.edu
Message-ID: <1993May10.175458.20576@cherokee.nsuok.edu>
Source record: 281838

I was building me a cable for my TNC and I need to know which part of
the plug is what. Or if someone out there has made a cable before and would
like to tell me which wire goes where, I would appreciate it.

The short plug has 3 wires, The long plug has 2. Which goes where. My
TNC has the following:
Mic Audio
Speaker
Push-to-Talk
Ground/Shield

Any help would be appreciated. Thanks...

If you understand it's limitations, PVC pipe is useful for some
amateur purposes. I use a 10 ft 1 1/2 inch PVC mast to support
a 40 meter inverted vee with a balun at the top. It is guyed at
90 deg from the elements with nylon rope to stabilize it, no bending.
The biggest advantage is that it is non-conducting. Sorry, we
don't have temps cold enough to shatter PVC here and I don't really
care how heavy it is in this application...

: > 1 / [sin(2*PI*1000)/2 + 1]

: Now that's a bit naughty - not only have you turned a multiply into a
: divide but you left the 'pi' out! Could you be trying to fool us?

: >So the resulting signal is just:
: >
: > sin(2*PI*1000000) an unmodulated signal.
: >
: >Does this unmodulated signal have sidebands? If not where
: >did they go?

: Ah, but if we were to write out the maths properly (!), we would find that
: the following would happen.
..
: I think (but am not sure :-)) that you intend to multiply this at the rx by:

: [1 + (sin(2*pi*1000 + pi))/2]

No, I meant what I said. One detail I skimmed over was that multiplying by

1 / [sin(2*PI*1000)/2 + 1]

is not equivalent to sine-wave modulation. The above equation is
pre-distorted in just the correct way to cancel the original modulation.
That's also why I used 50% modulation rather than 100% -- otherwise you
would be dividing by zero at negative modulation peaks.

>built-in or did these guys have to invent one?
>
>If anyone has details on this stuff, please post.
>

No details, but here is the jist. Many cellphones can be put into a
"service mode" from the keypad. This mode often includes a scanning feature
or the ability to dial in a freq for listening or xmiting. This info is
usually not avialable in the user manual, but I got the info for my
phone from the shop where I bought it. On my phone (DiamondTel 22x)
all the user programming and memories are lost if you put it into the
service mode.

I don't believe the hand-off codes, etc. are hard to figure out. I'm
sure they are published. A good lit. search should find articles.

In normal operation, the cellphone scans a band of control channels
for the strongest cell. These signals are low baud digital FSK
which contain carrier ID, cell ID, etc. When a call is placed or
received, a communications channel is assigned via the control channel
and the phone. Calls are handed off from cell to cell (and channel
to channel w/in a cell) by a short FSK burst containing the new channel
number, cell number, etc. You can hear these hand-off bursts with
a scanner about 2 seconds before hand-off. The cellphones themselves
don't pass the audio burst, you just hear an annoying 1/2 second loss
of audio.

The kind of digital interface to cellphone you want is rare. Most people use a scanner. With a digital interfacing scanner, audio FSK decoder, and computer, it is simple to write the software that follows a call from channel to channel and cell to cell. This would also tell you the location of the caller (which cell he is in).

I'm sure there are some cellphone phreaks here who could provide more info including the structure of the digital control messages. I'm all ears! Of course all this is totally illegal, but harmless fun.

Hi

I am new to HF and I am in the process of setting up an HF
station. During some of my tests I have experianced TVI and
I want to get a low pass filter for my rig. I have been given
a few recomendations (B&W, Bencher, and ICE). Does anybody
have any experiance with these manufactures? What is a good low pass
filter manufacturer? What specifications should I look for if I want to
operate 80 - 10 Meters with this low pass filter
in the transmission line? What should the cutoff freq. be?
What kind of antenuation should a good filter have at 50 Mhz?
what should the insertion swr be?
How much power should the filter handle assuming I want to run
the legal limit some day? What are the trad offs on these paramiters?

Please send your comments to me or post them to the net. Everything I
get will be reposted to the net in sumation.

Thanks for any help

: something like UN*X - you just got to know, son.

It's more an art than a science. You start by placing all the
IC's and physically large devices. This is the most important step.
Take some time figuring out which IC's have lots of interconnections
and place them close together. On a microprocessor board, for example,
place all the memory chips so the address and data bus flow in as
straight a path as possible from CPU across the board. Don't worry too
much about the odd line or two that has to go from one side of the board
to the other -- concentrate on bus lines, since there are so many of them.

Parts with only 2 or 3 connections, like resistors, capacitors,
transistors, etc. can be placed close together. IC's need to be spaced
farther apart to leave room for the connecting traces.

Start with plenty of room between parts. If the board ends up too big,
you can move the parts closer together later. It's much easier to see
how close to put them after you have the traces hooked up.

Before you start routing traces, decide on your design rules. That is,
what is the thinnest trace your PC fabrication process can handle without
etching the trace down to nothing. Also what is the closest you can place
traces without danger of a short. If you have your boards made by a
company, they can tell you what design rules to use.

I prefer to place all pads on center, if at all possible. This means
place all parts on a .1" grid, or .05" or even .025" when necessary.
This makes it much easier to route traces (with most software) and
easier to calculate clearance for design rule checking.

Laying out PC boards is actually pretty easy, if you have plenty of
board space available. It only gets hairy if you try to mineaturize.

Some software nowdays has auto-routing capability. I have found that
it works pretty well if 1) You are not trying to mineaturize,
2) You do a good job of preliminary parts placement,
3) You have no layout-critical circuits (like RF transmission lines) and
4) You are willing to go back and "clean up" manually after the
computer does its job.

A full-sized G5RV works pretty well on 80/40/20/15/10 meters. When I say "pretty well" I mean that it has a low enough SWR on all 5 bands that you can load it up with just about any antenna tuner. With a tube-type rig, you can often get it to load up fairly well without a tuner. It does NOT have low SWR on all 5 bands. But if you load it properly, it gets out like a champ for such a simple antenna.

Source record: 281768

jbromley@joshua.intel.com (James Bromley~) writes in part:

> Plate modulation has the advantage of high efficiency. Period.

A key point. The final (rf) amp can deliver only so much total power and still stay within its ratings. An early edition of The Radio Amateur's Handbook (ARRL) cites efficiencies of 30% to 35% for control grid modulation, and 65% to 75% for plate modulation. This sounds right -- the aforementioned AM bootleggers could get considerably more unmodulated carrier power with plate modulation, subject to the caveat of not exceeding tube ratings.

> Control-grid modulation, screen-grid modulation, suppressor-grid modulation
> and cathode modulation are *all* high-level modulation methods when
> applied to the final amplifier. As is plate-modulation when so applied.
> The key consideration is that the modulated stage has no linearity
> requirements imposed upon it.

Some of the old rf power tetrodes were notoriously nonlinear when strictly plate modulated. The trick was to use a combination of plate and screen modulation.

Private e-mail to the original poster, jchappel@sander.lockheed.com (Joel Chappell) bounced, but he mused on how many ex-AM-bootleggers are around. Quite a few, I expect.

>
>As far as return postage, what do you do? Throw in a buck?
>I think not. I guess an IRC would work, but can anyone advise?
>

I suggest finding a VE or XE who is willing to help you - the US
doesn't have direct mail service with Cuba, while both Canada and
Mexico do. Send your card to your VE/XE friend with 3 SAE's --
one to Cuba, one for the return to VE/XE, and the final one for
the return to you. Include 1 IRC for the Cuban station, and a
couple of IRCs or GS for your friend. Don't send US $ to Cuba-
I believe it is illegal for Cuban nationals to posess US currency.
There is at least one XE station willing to do this. His call
was in a recent DX Bulletin, but I don't have the reference with
me.

2293. Stacking dipoles for gain...

Newsgroup: rec.radio.amateur.misc
Date: 1993-05-10 20:49:24 UTC
From: weaver@kuttner.sfc.sony.com
Message-ID: <1993May10.134924@kuttner.sfc.sony.com>
Source record: 281850

I have a question about power gain from "stacking" dipoles,
particularly at 5/8 wavelength intervals.

It's a common thing in the broadcasting biz to stack dipoles ONE
wavelength apart, and get a power gain of N from N radiators. It
works 'cause the FIELDS add together and you divide the POWER between
them. Thus you wind up with N^2/N = N times the power "out there."
This I understand okay...

But what about (take the simple case) a pair of dipoles at 5/8 wave
apart, fed in phase? The ARRL Antenna Book, in that page full of
azimuth patterns, shows major lobes horizontally, minor lobes (-6 dB)
vertically, and a gain of 4.8 dB, or a factor of 3! I am sadly unable
to visualize how this works.

Furthermore, how much gain can one get from stacking more dipoles at
5/8 wave? I have long wanted a nice omni horizontal gain antenna for
our RPU repeater, and if 4 bays of this would get us 10 dBd I'd gladly
take the time to build it.

I have used both Zepps and G5RVs.. I find that the Zepp does
have more gain than the G5RV.. The problem I had was that the Zepp
was getting too much RF into my shack... I cut the ladder line and
spliced on some coax.. it works real good as a soughta G5RV.. it
loads on all bands and gets out fine...

I have use parallel dipoles (4 different wires tuned to 10,20,
40 and 80 and 15 loads as harmonic)... was the worst antenna
I ever had.. everytime you tune one band .. it detunes another..
it was only $50 with all the parts and doesn't need a tuner..about
the cheapest way to go if you have weeks to tune it.

We use G5RVs now for field day and do very well... last year one of
our stations put up a G5RV in about 8 minutes only up at about
30 feet, turned on the rig and worked Israel.. I grabbed the
mike and after a few calls also got through. I have made thousands
of contacts on mine...

>This I understand okay...

Umm, maybe you don't. I think the physics guys would object to anything that results in N times the power you put in, going "out there". What you have in any directional antenna is taking some power that's going over here and focusing it to go out there instead. For a 10 dBd antenna, that just means that _in the major lobe_ you have 10 dB more radiated field strength than you had with one dipole. This is why you don't want to use a n=large antenna on a tall mountain with people listening right below it; the main lobe just zips over their head.

You can figure the directional pattern or "gain" in any azimuth and elevation by working out how the phases of the radiated fields add up. Same as in acoustics. Say it's a 2-bay antenna spaced one wavelength apart and fed in phase, and you're out at the horizon. You get a power doubling _in your direction_ because the fields add, as you mention. But go up 30 degrees, and figure (simple trig) the path lengths from each of the bays to your receiver. The wavefronts from the two bays don't add anymore, they're not in phase anymore. This applies to any number of bays, any amount of spacing, and whether they are vertically stacked and you're looking for gain at the horizon at the expense of skyward and shrubbery-ward, or if they're vertical spikes in a marsh and you're looking for gain in one azimuth at the expense of a null in another (AM directional).

I don't think 5/8 wave spacing would be useful for much. Stick to one wavelength, if you want to make a better gain RPU antenna, look at the ARRL antenna book thing for making a Stationmaster clone out of RG-8 or RG-214 inside a vaulting pole.

[Aside-ask Pelzel what I knew about antennas 14 years ago and when he stops cackling, you might call me for more on this ;-)

Cheers
DJ

How about fiberglas tubing? It is much stiffer. I am thinking of using a 20 ft. length of 2 in. dia tubing to hold up a delta loop. The cost isn't cheap (I will pay about $100 for a 20 ft. length), but I will save a lot in stiffening expenses. I realize that this is a deviation from the original question, but PVC seemed too flimsy for more than several feet.

Drew-

I haven't been keeping up with the latest CB designs, but was successful at developing conversions for several radios, about 10-15 years ago. The "best" one was a Sears SSB transceiver that used the 10.240 crystal you mentioned. However, that crystal was for deriving the PLL reference frequency. If you change its value, you will affect channel spacing more than channel frequency!

That particular Sears radio may have used a total of 6 crystals, as I recall. Two were for carrier generation, and were above and below the center of the 10.695 MHz first IF crystal filter. Another converted to the 455 KHz second IF (on receive only?). The 10.240 MHz was divided by 1024 to provide a 10 KHz PLL reference, and hence the 10 KHz basic channel spacing.

The two that I changed to move the radio's range, were also for upper and lower sideband. As I recall, these crystals were in the 12 MHz area, but were multiplied by three, to provide a 36 MHz area signal. To change the radio's frequency, the crystal frequency was changed by one third the amount you wanted to move the radio.

In one conversion, I rewired the carrier oscillator switch so that both positions were Upper Sideband. I selected the two new crystals so that they were 5 KHz apart on ten meters. By adding a small inductance in series with the Voltage Variable Capacitor, the RIT was expanded to a little over 5 KHz. I also made it work on both transmit and receive. Thus, the 40 channel radio provided 80 each, 5 KHz wide sub-bands.

I also developed a second version of this conversion, that divided the 10.240 crystal by 2048, to provide 5 KHz basic spacing. There were a couple other tricks with the channel selector switch, that increased the number of "channels" to around 90, not counting duplicates. However, the VCO couldn't handle such a wide range unless the 5 KHz spacing was used.

The result was a "smooth" transceiver, that worked well on receive, and sounded good on the air. However, you had to keep a frequency vs. channel conversion chart handy, if you wanted to know what frequency you were near!

In today's world, the Radio Shack HTX-100 is cheaper than the old Sears SSB CB, and has direct digital frequency readout (although they are usually 100 Hz or so low in frequency!).

2304. Radio FAQ Retrieval Stats for news.answers Archives

Newsgroup: rec.radio.amateur.misc
Date: 1993-05-11 00:02:11 UTC
From: pschleck@cwis.unomaha.edu
Message-ID: <1993May11.000211.1624@news.unomaha.edu>
Source record: 281863
Cross-posted to: rec.radio.amateur.misc,rec.radio.shortwave,rec.radio.info

The following are some archive retrieval statistics from the news.answers archives at grasp1.univ-lyon1.fr and ftp.win.tue.nl. Although these are the smaller mirror archives in Western Europe (North American readers should use either rtfm.mit.edu under /pub/usenet or ftp.uu.net under /usenet), the statistics are useful for comparison. Statistics for the radio-related FAQ postings, in addition to the most popular Usenet FAQ for comparison, are provided below. The entire set of statistics are available via anonymous FTP from grasp1.insa-lyon.fr under /pub/faq-stats/APRIL-1993.

(Note: Since the exact archive names for the radio FAQ's were recently changed, the archive statistics had a combination of new and old archive names. I've substituted the new names where applicable.)

Summarized servers: grasp1.univ-lyon1.fr, ftp.win.tue.nl

Does anyone have modification information for the Eurpoean version of the Kenwood TH-77A? I was the author of the TH-77A version so I already have that information. Someone in Spain contacted me looking for mods for the TH-77E since the 77-A chip resistors are layed out a bit differently.

Thanks for any help!

2307. Icom W21AT or Kenwood TH78A? Any opinions?

Newsgroup: rec.radio.amateur.misc
Date: 1993-05-11 03:19:36 UTC
From: rane+@cs.cmu.edu
Message-ID: <C6uEKp.507.2@cs.cmu.edu>
Source record: 281868

1st off - anyone out there know where I can get all
the relevant materials inorder to get started in
amateur radio? I was looking through the flyers,
magazines and literature than my dad brought home
Dayton (he's not a ham either) and this looks like
an interesting way to ignore work ;-). I'm in the
pittsburgh, pennsylvania area, so if anyone else
out there is too, could you drop me a line about
the testing dates and material or where I can get it?

And secondly, has anyone compared the Icom W21AT and
the Kenwood TH78A? Could you tell me which one you
chose and why? I'm pretty sure I want a dual bander,
unless you can give a reason to go with 2m only (in
which case I'm looking at the Icom P2AT and Kenwood TH28A)

Finally, where do most of you do buy from? (mailorder).
Several groups I know of keep a FAQ/listing of readers
experiences with various mailorder places (rec.photo,
rec.audio,rec.video), is there anything like that for the
amateur groups?

Thanks,

Aaron

2308. Yaesu FT-530 - VCO Question

Newsgroup: rec.radio.amateur.misc
Date: 1993-05-11 03:29:11 UTC
From: slr@cco.caltech.edu
Message-ID: <1sn6i8INNocl@gap.caltech.edu>
Source record: 281869

First off, many thanks for the replies I received on my recent post reagrding opinions on the Yaesu FT-530.

Today I bought one! - Tonight I did the modification. (I've already modified another one of these so doing it the second time was fairly easy.)

Transmit seems to work from about 400 Mhz thru 459.5 Mhz. Does anyone know if the VCO in this radio could be re-tuned for 420 Mhz - 479 Mhz ? (Although the 400-420 Mhz offers quite a bit of interesting stuff to listen to, esp. here in Los Angeles, I really have no desire to strike up a QSO with the DEA :-)

I seem to recall some of the Icoms having a pretty wide VCO tuning "window" about 50 Mhz wide on UHF.

I called Yaesu today and was told they have a NEW VCO coming out around July. The person I spoke with didn't seem to know if existing radios could be retrofitted or not.

Anyone else know ?

>make a call if there was a problem. If you did call how were you treated.

I bought a FM 20MHz receiver kit last year, mainly because I wanted
a working circuit with an NE602 to see how critical the layout really is.
Three parts were missing and one hole in the board was misdrilled (the
wrong small hole had been drilled out big). A fax to Ramsey produced
quick shipment of the missing parts. The unit worked OK, although I don't
have any compatible receivers to judge it against. I got images of TV audio
channels (clipped, because this is a narrowband receiver), ambulance dispatch,
and an occasional cordless phone, so it's functioning.

I think they're great people, but they're not Heathkit; this is
a small-scale operation. A good way to get started in electronics.

: going to be included as part of the NPRM.

Get your fact straight. You retrograde dweebs are working on a
Petition. The Notice of Proposed Rulemaking that revised the
Technician Class was the result of several petitions over several years.

One of those petitions was the result of a mailing list here on the
net. (And if you think this stinking little pile you've dropped in
this newsgroup is anything, you should have been here several years ago.)

Here's a quote out of the regulations (I'll leave it as an exercise
where it is. I've no intention of giving you any aid.)

" Petitions which are moot, premature, repetitive, frivolous, or which
plainly do not warrant consideration by the Commission may be denied
or dismissed without prejudice to the petitioner."
(Which, as I understand it, they'll ignore you, but not punish you
for wasting their time.)

So make sure your crayon is sharp, the folks in the Private Radio
Bureau will probably want to hang your great creation in their
bathroom.

>and no clear cut answers exist. I once read that theory particularly the
>math and physics end are a natural for "left brained people" those whose
>tendancy is to Logic based reasoning.

In 1966, when my father got his Technician license, the test was MUCH harder than anything they've got today. For example, there were at least five questions showing an untitled schematic and asking "What would happen if resistor R5 opened?" or "What if C2 became leaky?"
My father didn't know Ohm's law from Murphy's law, literally. He had no idea how to measure current and couldn't even remember E=IR. The total extent of his electronics knowledge was his ability to change light bulbs and bang the TV when it went on the fritz. But he passed after a few months of diligent study, on his first try. Same with his General class some months later (after he got the code speed up).
When incentive licensing came into the picture circa 1967, he decided on a whim to stop while he was near the FCC office and take the Advanced class exam, figuring if nothing else he'd have spent four bux and he'd have an idea what the test was like. He came home laughing at how incredibly simplistic the test was. He passed it without any preparation.

>2) code is easy for some people and not for others. The reasons are varied and
>no clear cut answers exist for the difference. In the same article it pointed
>out that "right brained" people have an easier time with things like code.
>These people are the ones whose reasoning is dominated by the emotion side and
>tend to creativity.

I fought the code, alone, for a year. For that year I had no help of any kind; the only machine-assisted method available was a monstrous, paper-tape-operated ugly beast (can't remember the name, the Something-o-graph) which I couldn't afford to rent. I finally got it up to the 5 WPM for Novice but still couldn't find anyone to give me the test. Eventually, I heard that Allied Radio was giving classes and persuaded my father to drive me down to take the classes so I could take the test there. I HATED the code. It most certainly did NOT come easy. But I wanted to become a ham badly enough that I forced myself to learn it.
Then I spent another year of at least three hours per day, listening to code on a shortwave receiver, getting my speed up to pass the General. That was bloody murder and extremely discouraging for the first six months. But I did it.
And every four years, at renewal time, I had to sign my name to a form certifying that I could still copy that code speed. And I could.

My father rented the whatever-o-graph, which sent terrible, choppy code.
He fought as hard as I had to learn the code and get his speed up. And
he did it, six months from 0 to 5 WPM, seven more from 5 to 13.

>For 6 months, I have been studying the morse code. I work at least 1 hour
>per day in 30 min sessions. I have the ARRL tapes, some other company tapes,

>I understood every answer. Checking the handbook and my electronics texts
>for anything I missed or was not sure of. I passed the tests easily without
>any misses. I already can pass both the general and advanced written tests.
>Haven't done it because I still can't pass the 5wpm code.

It took me about four years of studying magazines I couldn't understand
to learn the electronics, because I couldn't find any books to learn from.
Near the end of those four years I found a book I could at least learn the
regulations from. There were no test pools back then; whatever questions
you happened to find on one of the (how many were there?) different test
booklets, you had to answer from innate knowledge. If you failed, you had
to wait 30 days before re-testing.

>I am continuing to plug at the code. I think within the next month or so I
>may consistently get 5wpm. Then I'll take the 1A test and the general written
>test. Then I will work the rest of the year to try to get 13wpm.

You'll _certainly_ never hear that from _me_!

>happy for them. However, there are other avenues into the Ham hobby and the
>Amateur SS ought not be determining who and how REAL people should be allowed
>in the hobby.

I guess you haven't read the part yet that says that Amateur Radio is
supposed to be self-policing. Whether you mean Schutzstapfel [sp?] or
Secret Service by that crack, your statement seems to take the exact opposite
view, or at least suggests that you don't want ANY policing.
It has been only through the diligent self-policing efforts of other hams
(such as refusing to talk to unlicensed people, tracking down repeater
jammers, the ARRL's Official Observers, etc.) that ham radio has not been
degraded to the level of CB. It is my observation that the easier the tests
have become (they're absolutely laughable now), the worse the bands have
gotten. If you want to see a radio service which formerly had requirements
for licensing, detailed operating rules, etc., which has deteriorated over
the years through relaxation of the rules and eventual removal of the

licensing requirement, tune in channel 9 and have lots of fun with the
echo-box jammers.

>I'm now a ham (as soon as the FCC does its part) and proud of it. I intend
>to upgrade as soon as I can get past the code obstacle. It isn't easy but it

It certainly IS worth it. But remember, it's what YOU make of it.

>is worth it. Although I question incentive licensing when it makes some
>people think that they are superior to others.

Incentive licensing has been under ridicule since its inception, and has
done little for ham radio except to establish class castes and cliques of
holier-than-thou, my-license-is-better-than-yours folk. Before that, the
Extra Class was a real mark of distinction, as those who took both that test
and the 1st Class Radiotelephone (Commercial) Operator's license test said
that the Extra was _much_ more difficult to pass. (Still, most who took
it still did so out of a sort of snob appeal, since General class was as
high as you needed to go to get all Amateur privileges.) I only took the
Advanced test to stop my father's incessant nagging; to me, it wasn't worth
the 20-minute trip downtown. It was my perception that only the ARRL wanted
incentive licensing introduced, and still is.
Keep the faith, keep on plugging, you'll get there and you'll feel like
you've accomplished something more than popping into a Radio Shack and
buying a CB and a mag-mounted rubber duck.

How about international law, one of those little items you were supposed
to learn about to be granted a ham license?

>all it wasn't that long ago that no-code meant no license. Why do you draw a
>line at HF? It sounds to me like "I had to so should you." If that is the
>standard you wish to apply lets not give anybody civil rights either, unless
>they can recite the Constitution (I had to in school).

Learn to recite some important parts of communications law instead. It's
your duty as a ham.

>I don't see how a code requirement advance any of the principles of our service.
> One of the purposes of the amateur radio service is to create a reserve of
>trained electronics techs. I think you could make a case for more stringent
>tech. requirements.: little bit bent out of shape. As for the opposition to the no-code

1: WRONG-O. 2: RIGHT-O. One of the purposes of the ARS is to create a
reserve of trained RADIO COMMUNICATIONS TECHNICIANS. The electronics tests
were MUCH more stringent in 1967, and my father passed the tests knowing
next to nothing about electronics; the tests today are a joke. In Chicago,
I can hardly turn on the 2-meter rig on any day without hearing a chat between
a pair talking about how the destination ham is going to solder a coaxial
connector onto some coax for the driving ham. It's not at all unusual to
hear questions about electronics on the air which are so simple, and
indicative of absolutely no electronics knowledge, that they would make a
second-WEEK electronics 101 student laugh. It's not at all unusual to hear
people operating FM voice on 144.01 simplex (do you know the TWO reasons
that's illegal?), or in the satellite bands or over a beacon.
Let's try a scenario. The "big one" his Los Angeles. No power, no
repeaters, most equipment is junk, no transportation, no phones, no
communications. While you're still trying to figure out how to modulate
a carrier, I'll be on the air, with a LEGAL transmitter in a LEGAL ham
band, communicating with the outside world, because I can design, build
and power a CW transmitter/receiver... and I can use CW.

>: license, well... if you look at QST roughly 10 years ago there's a
>: violent no-code stance in it.
> ^^^^^^^^^^^^^^^^^^^^^^

>Do you mean a violent anti-no-code or pro-no-code stance?
>Sorry I didn't keep up on QST until I became a ham in '91. If you mean
>anti-no-code then I guess we can all grow and change with the times.
>Growing should never stop.

The ham world was violently against having a no-code license of ANY
kind. By that time, the tests were so simple that the only thing anyone
really had to work at to get a license was CW; some thought of that as an
exclusion for CB junkies effortlessly easing their way into our midst.
Still others had been through situations where CW was the only way they
could communicate with others at one point or another and realized the
value of knowing CW. Yet more others realized that, to talk to people
in poorer countries where ham gear is/was frequently homebrew junk that
could only operate CW, we couldn't fulfill one of our mandates (that of
enhancing international relations with people of different countries)
without being able to talk CW with them, or at least understand what they
were sending. And finally, most all hams knew back then that it was (and
still is) international law that amateurs licensed to operate below 30
MHz had to demonstrate proficiency in the Morse code.
Wait... let me think. Getting more CBers into the ham bands... not
being able to communicate under certain circumstances... degrading
international relations through removing a form of communications with
hams in other nations... violating international law... yes, that IS growth.
Sorry I carried on so. I take it all back.

> One of our others duties is to train pro. quality COMMUNICATORS.

"Other" duties? (See above.)

>We don't need a morse code proficiency test to keep the ham bands from turning
>into a mess like we see on CB. What we need to prevent that are a bunch of

No, we have that fantastically difficult technical test to pass.

>amateurs that care enough to help others out and show them what being a good
>operator is all about. But looking at the mess ours bands are already in I guess
>that is not very likely to happen. In my brief time as an amateur I have

Part of the reason the bands are in the shape they're in now is the
long history of relaxing the requirements to get a license, or to upgrade
to a higher class (and thus more privileges).
If you're convinced that being helpful and showing others what good
operating techniques are will improve things as the licenses become
available for two Cocoa Krispies boxtops, try your theory out on CB
channel 9 for a bit.

>elmered four new no-codes into amateur radio. (my girlfriend is number 4 and
>her license should be in Thursday's mail) They all know how to *operate* their
>radios. They all help keep our local spectrum from looking like CB. They have
>all participated in public service events, (my girlfriends first will be May
>15th) they can all make a dipole and none of them whine.

Now THAT is something constructive. Keep that up and prove people like
me wrong.

> I would rather hear a bunch of appliance operators who are coureous and
>put out clean signals than some idiot who splatters all over the band and
>care where he/she tunes up, tries to throw people off 'their' frequency because
>'I always have a sked here' It is always the courteous operator, or usenet user
>that get listened to, not just the one who is heard most loudly.

Oh, I see you heard about CB channel 9, eh? Must not have listened, though,
because 5 minutes is all it takes to show that the one heard most loudly
(usually screaming "Walk walk walk on you" or something about excretory
functions) always overcomes the courteous, clean-signaled one.
I reiterate; there's little to keep that loud, splattering lout off the
ham bands any more. When enough of them find that out, courteous operating
techniques and good example ain't gonna help. Try this simple quiz:

The easier the test for a driver's license gets, the worse the drivers
on the road get and the more bad drivers get on the road.
The easier it is to pass through grade school, the lower the SAT scores
and the achievement scores of the students there.
The easier it is to get a ham license without knowing a thing about
proper, multimodal communications, the ________ (better/worse) the class
of people you find on the ham bands.

>And I was doing so well at staying out of this whole thread. ;-)

Something I'm going to strive to do in future myself.

>the 7.2v battery. Any nice person have the bigger battery? Thanks.

Noting that the charger that came with my DJ-180T (I believe it's the
2-meter-only version of the same rig) says it puts out 8.7V @ 70 ma, and
14.xV @ 70 mA, and knowing they have the same amp-hour capacity, I'd
venture the guess that 14 hours is just right for the higher-voltage
battery as well. (If you notice, the contacts on the HV battery will be
configured differently than for the LV battery, suggesting it will, of
course, use the higher-voltage output of the charger.
Or, better yet, if you can afford it buy the better charger and only
use the stock trickle charger occasionally. :-)

ZCZC AG94
QST DE W1AW
ARRL BULLETIN 53 ARLB053
FROM ARRL HEADQUARTERS
NEWINGTON CT MAY 10, 1993
TO ALL RADIO AMATEURS

ON MAY 7 JOINT RESOLUTION S.J. 90 WAS INTRODUCED IN THE U.S. SENATE
BY SEN. CHARLES ROBB OF VIRGINIA. IT'S A BILL RECOGNIZING THE
ACHIEVEMENTS OF RADIO AMATEURS.

ROBB, SAYING THAT WORDS WITHOUT DEEDS ARE EMPTY, WENT FURTHER. THE
RESOLUTION, SUPPORTING AMATEURS ''AS NATIONAL POLICY,'' URGES
''ADOPTION OF RULES AND REGULATIONS THAT ENCOURAGE THE USE OF NEW
TECHNOLOGIES WITHIN THE AMATEUR RADIO SERVICE.''

IT ALSO ''URGES THAT ANY REGULATIONS WHICH ARE NECESSARY AT ANY
LEVEL OF GOVERNMENT BE CRAFTED IN WAYS THAT FACILITATE AND ENCOURAGE
AMATEUR RADIO OPERATION AS A PUBLIC BENEFIT ... WITHOUT LIMITING
THE DECISION-MAKING CAPABILITY OF ANY AGENCY -- LOCAL, STATE OR
FEDERAL.

ROBB WAS JOINED IN INTRODUCING THE RESOLUTION BY SENATORS AKAKA OF
HAWAII, DECONCINI OF ARIZONA, PRESSLER OF SOUTH DAKOTA, AND SHELBY
OF ALABAMA.

ROBB NOTED AMATEURS' DEDICATED PUBLIC SERVICE DURING COMMUNICATIONS
EMERGENCIES, THEIR ''EXPERTISE'' AS ''TECHNICAL INNOVATORS,'' AND
THEIR DEVELOPMENT OF ''PRACTICAL AND AFFORDABLE ALTERNATIVES TO
COMPLICATED EXPENSIVE NEW EQUIPMENT FROM THE LABORATORIES.''

THE RESOLUTION ALSO CITES AMATEURS' PIONEERING WORK IN SATELLITE
COMMUNICATIONS AND ''LOW-COST, PRACTICAL DATA TRANSMISSION BY
RADIO.''

THE RESOLUTION URGES THE FCC TO ADOPT RULES AND REGULATIONS TO
''ENCOURAGE THE USE OF NEW TECHNOLOGIES WITHIN THE AMATEUR RADIO
SERVICE,'' AND SAYS ''REASONABLE ACCOMMODATION SHOULD BE MADE FOR
THE EFFECTIVE OPERATION OF AMATEUR RADIO FROM RESIDENCES, PRIVATE
VEHICLES AND PUBLIC AREAS, AND THAT REGULATION AT ALL LEVELS OF
GOVERNMENT SHOULD FACILITATE AND ENCOURAGE AMATEUR RADIO OPERATION
```

AS A PUBLIC BENEFIT.''

> Alinco DR-570 and DJ-580 will both scan the cell phone frequencies.
> All the information you ever need on AMPS cellular phones is contained
> in EIA/TIA-553... Cecil... KG7BK

This makes sense but I'd like to find any of the secret stuff
inside my ole Novatel. I have the programming unlock code and a
list of all the "dealer" codes, but have wondered if there was
more and how to get to it.

Not maybe worth the time to wobble the uC, but fasinating to me
none-the-less. I'm looking for more stuff to do with the phone
than to watch the signal-strength meter, if you get my drift.
Listening in to other conversations beyond having the "ability"
to do it, is not of prime importance.

Hee - when I read this what my mental voice said was '...HAMs with a "zed" in
their callsign sometimes say the (word?) "zed" instead of just plain "zed"'!

Took a couple of passes to realise the problem :-)

"Zed" is usual in the UK. "Zee" is regarded as an abberation.

By the way, if you work any GM stations, watch out for "J" - In England
it is pronounced "Jay", but in Scotland it is often "Jeye" (like the
word "eye" with a J sound in front.) That even caught me out when I moved from
G to GM.

Vive la difference!

73, and hoping you have many happy years on the bands,

John.

Hello agn all DXers!
We will make a little trip to Eastern part of Aland Islands next weekend.
Our qth will be Brando Island, OHC-001 and IOTA EU-02. We will be landing
there at friday evening and we will leave the island monday evening
(14th - 17th of may). Our group consists of 5 hams from Tampere area
and most of us are not so experienced dxers. So please be patient if
hear us on bands, this is more like a holiday than a serious DX-pedition.
We will use our own callsigns, so look for OH0MEP (Pete), OH0MFT (Antti),
OH0LYA (Seppo), OH0KLG (Matti) and OH0/OH3YM (Jussi). All qsls sure
via homecalls in OH3*** , If You prefer direct qslling, they are ok via
<CALL> , P.O.Box 179, 33101 Tampere, Finland , EUROPE.

CU on bands!
Pete , OH3MEP

Forget the G5RV antenna - I believe it is only a G5RV when it is of a particular length - changing the size it ceases to be a G5RV.

I don't know why people insist on feeding a balanced antenna with unbalance feeder and still use an ATU at the bottom.

I would recommend a Doublet - This is like the G5RV, but instead of a coax run to the shack, you use twin feeder - and then use an ATU at the shack. This is less lossy too.

Advantage of a doublet is that most lengths are likely to tune up on most band. I have one that is 20 metres across the top with about 10 metres of feeder. It tunes up on just about all bands from 10 to 80m.

If you want an entire manual (I can only assume it has a copy of
the schematic) it is available from:

HI Manuals
POB 802
Council Bluffs IA 51502

The price is $9.75 postpaid. They do not have a telephone but
they are a reputable mail-order company. Send $2.00 to get a catalog
of hundreds of manuals.

2326. How's a Honda Accord w/50W VHF?

Newsgroup: rec.radio.amateur.misc
Date: 1993-05-11 12:50:00 UTC
From: TOM@aro-emh1.army.mil
Message-ID: <9305111153.AA28277@ucsd.edu>
Source record: 281787

I installed an Alinco DR599T dual-bander (50 watts on VHF/UHF) in my wife's 92 Accord. Works like a champ, with no difficulties. Antenna is mounted on the trunk, radio control head on the transmission hump.

I received the "Honda Package" from ARRL before I bought the vehicle. Honda states that there should be no troubles from RF. You might contact ARRL and see if that's still the case.

2328. Packet Rules Question

Newsgroup: rec.radio.amateur.misc
Date: 1993-05-11 13:33:50 UTC
From: turini@gdls.com
Message-ID: <1so9vu$h2c@gdls.gdls.com>
Source record: 281793
Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.packet,rec.radio.amateur.policy

Current FCC rules allow for the "participation" in amateur radio by non-licensed people. With HF, I have taken this to mean that if a licensed amateur was controlling the station, provided the communication was between US stations, a non-ham could speak into the mic.

I assume that this extends to packet via BBSes and direct. I.e. as long as a licensed ham is in control of the station, a non-licensed individual may enter in a packet message to send.

I do a lot of demos at schools and with the scouts. In the past I have mainly done HF and VHF, only recently starting with packet.

Thanks for any comments

Colin, I would recomend the IC-735 as the radio for your use. It is compact, works off 12 volts DC, and can be easily run at reduced power when running off batteries. It has general coverage receive, and the receiver section of the radio is excellent. It can do 100 watts if necessary, and it's heatsink design is also excellent which can be important in the tropics.

If direct voice contacts are what you want, the 10, 15, and 20 meter bands will normally be your choices. You follow the MUF as closely as you can for best results. Even though 10 meters is dying as a worldwide band, the propagation North-South will remain good often enough to be the band of choice many days. 40 meters is a bit of a zoo, but would likely work in the evenings, and 80 meters may be usable later at night in winter. If you wish to use the digital modes, 30 meters is an attractive alternative. The IC-735 covers all of these.

If you're going to be in a fixed location where you can put up large wire antennas, or a quad, you'll be in good shape. If you are moving about a lot, improvised wire antennas, or a vertical whip along with the Icom automatic antenna tuner would be a good choice. At the simplest, a roll of wire and a manual tuner will allow you to improvise an effective antenna anywhere you can find supports (trees).

If you wish to use packet, you need more equipment. You'll need a TNC and a computer or terminal. Considering the power situation, you may want a CMOS TNC like Paccomm makes, and a laptop. You can press things like a HP-95 into packet service, and you can use things like the Baycom modem, but you'll get better results with a system optimized for HF. Off the shelf that usually means the PK232 or the KAM.

Be aware that HF packet is *slow* and often requires many repeats.
It's good for passing mail type messages between patient machines,
but is very much less attractive for interactive conversations.
It can be just the ticket for keeping in touch with someone back
home who can't meet you on the air, however.

Phone patches on HF are sometimes workable. I'll leave the legalities
to someone aware of the third party rules between Canada and Guatemala.
I think it's OK, but don't accept my word on it. The major problem with
phone patches is finding a patch partner on the other end who will be
willing to work with you day after day. Such people exist, but hooking
up with them is rather hit or miss.

The other sticky issue is licensing in Guatemala. Since there has been
guerrilla activity in the country, it may be somewhat difficult to get
permission to setup ad hoc stations in the rural areas. It may also not
be safe if you are mistaken for CIA. :-(

>How much power should the filter handle assuming I want to run
>the legal limit some day? What are the trad offs on these paramiters?

Lots of questions Dave. I've used the B&W filter, it will handle the
legal limit with low VSWR loads. It's important that you bond the filter
to the transmitter chassis for best results. Using it freestanding in the
line will often do little to suppress harmonics, they'll happily flow *around*
the outside of the filter due to induction. The insertion VSWR will be
low, but for best results you want the filter to be looking into the
proper impedance. That usually means you mount it between the transmitter
and the antenna tuner. You should be able to obtain 30 db of suppression
at 50 MHz. A good tuner will often double as a low pass filter, depends
on the network design, and will add to that suppression.

It should be noted that it's rather rare for good quality commercial
transmitters to have strong harmonic output. It may well be that the
TVI you are suffering is not harmonic radiation, but rather fundamental
overload in the affected TV. A low pass filter won't help this problem.
A high pass filter on the offending TV may help, as will orienting the
respective antennas so that they are not in each other's near fields.

Gary

I have a '90 Accord which is essentially the same as the '93. In the
past I have used a GE MASTR PROG on 6 meters with 70 watts and a mag
mount on the trunk --- no problems. Currently I have a Kenwood
TM-241A with 50 Watts --- still, no problems. I STRONGLY recommend
connecting the power directly to the battery. Honda vehicles seem to
generate an unusually high amount of alternator whine when power is
connected elsewhere.

Yeah, Honda says there shouldn't be troubles from RF. They insist on saying that every time we call them to ask why I'm getting alternator whine on the receive side of my rig. Why does the phrase "full deniability" keep coming to mind every time we deal with them? Something tells me my Civic wagon is the last Honda we will ever own...

GM, on the other hand, is concerned enough about radio operation in their vehicles that they had a team of people, lots of literature, and a demo vehicle at Dayton this year. They were the only auto manufacturer there. Hmmm, maybe we should look into replacing the Honda with a Saturn...?? :-)

Seriously, you will probably find that your radio has no effect on the operation of your Accord, but that your Accord may have an effect on the operation of your radio. Not all Hondas are noisy, but the ones that _are_ noisy are a pain in the neck!

2333. FX-146 Ramsey VHF Kit.

Newsgroup: rec.radio.amateur.misc
Date: 1993-05-11 14:19:41 UTC
From: c23mal@kocrsv01.delcoelect.com
Message-ID: <1993May11.141941.21180@kocrsv01.delcoelect.com>
Source record: 281770

There is an article about Ramsey 2-meter radio kit in 73 Amateur Radio
Today, June 1992 issue. The author talks about two basic programs
one for obtaining the HEX address and HEX memory contents for the two
EPROM's, and the other program is to determine frequency select data.

I punched in both programs listed in the article, I did not have any
success.

The article also indicates that the programs are available in 73 BBS
with the name

FX146MOD.BAS

Is this program available on any ftp on the network or if anyone
can do me a favor and mail this program to me?

Also any additional feedback on this kit will be highly
appreciated.

2336. Re: no-code defense (really: learning morse code)

Newsgroup: rec.radio.amateur.misc
Date: 1993-05-11 15:08:31 UTC
From: paulf@umunhum.stanford.edu
Message-ID: <1993May11.150831.16772@leland.Stanford.EDU>
Source record: 281799

My own personal observation is that there must be a million ways to *mislearn*
morse code, and only a dozen or so ways that really work. A few hints:

1. The professional psychological work in the field indicates that the
primary predicter of morse code learning prowess is mental attitude;
if you think it's going to be tough, it will be. Yes, this does sound
like the typical hooey we get from psych studies, but in my observation,
it seems to hold.

2. Map sounds, not bits. This was my mistake for many years. It seems so
trivial, but it makes sense from a recognition theory point of view.
Don't, for example, memorize C as "dash dot dash dot", but as
"dah-dit-dah-dit"; note that you're "chunking" four items in the former
method, but only one in the latter.

3. Use subconscious formulation. No, I'm not talking about those "attitude
adjustment" tapes that you can buy through most ham magazines (although
they probably do have some effect, see #1), but instead using the SC
process in your favor. For example, while hacking away in the shack,
keep the radio tuned to 7.100 MHz, or some other constant morse source.
Remember, you're trying to get acquanted with the *sounds* associated with
morse code. Just here and there, pick out a letter and recognize it.
(Thanks to WA6AZP for this suggestion.)

4. Use your commute time. If you spend more than ten minutes each way
commuting, you have at least 20 minutes per day, every day, for some
practice. Just record a tape, using some of the computer generation
programs, slightly above the goal rate. Pop it in the cassette deck,
and drive. Now, perform the same technique as in #3 above, periodically
recognizing bits of the tape. This technique, aside from guaranteeing
regular practice, teaches you to divide you attention between the code
and something else (driving, but also writing).

Much of this process is purely psychological, which is why taking morse as
a class, with a few others for support, and somebody who knows how to teach,
works so well.

2337. ATV xmitter questions

Newsgroup: rec.radio.amateur.misc
Date: 1993-05-11 15:15:45 UTC
From: andrem@pyrtech.mis.pyramid.com
Message-ID: <1sofv1$1c8@pyrtech.mis.pyramid.com>
Source record: 281801

I've got a few questions with regards to an ATV transmitter
that I've gotten my hands on. The boards are made by PC
Electronics, and the identifier of the video board is TXA5.

The ARRL Handbook covers the TXA5 in it's section on ATV.
I have a few questions after reading through the description
and looking at the specs for the power amplifier used in this
application. Hopefully someone who's familiar with this design
can help me out.

The transmitter is intended for use in the 420-440 MHz range,
and uses a Motorola MHW710-2 as the power amplifier. Motorola's
specifications, however, indicate that this is not the correct
part for this freqeuncy range. The data book lists the MHW710-2
as being intended for use from 440-470 MHz. For 400-440 MHz, a
MHW710-1 is specified. Can anyone tell me why the -2 part is
used in this design rather than the -1? I plan to use the
transmitter at 434.0 MHz.

I also have a question regarding the output level of the TXA5
board. The ARRL Handbook indicates that the board provides a
80mW signal to drive the power amplifier. The specs for the
power amp list a maximum input level of about 250mW, with a
typical input of 150mW. Why is the TXA5 only driving the power
amplifier at only a little better than half of the "typical"
level specified for the device?

Words of wisdom with regards to this beast would be appreciated.

In article <2284@indep1.UUCP> clifto@indep1.UUCP (Cliff Sharp) writes:
> Let's try a scenario. The "big one" his Los Angeles. No power, no
>repeaters, most equipment is junk, no transportation, no phones, no
>communications. While you're still trying to figure out how to modulate
>a carrier, I'll be on the air, with a LEGAL transmitter in a LEGAL ham
>band, communicating with the outside world, because I can design, build
>and power a CW transmitter/receiver... and I can use CW.

Let me see if I can fully understand this. The "big one hits" and your
the only one with communications capability because you're going to build
your own CW transceiver and then use it to talk to the world. Indeed,
if all the equipment is rendered junk, by what stroke of luck do you
presume your home will be spared, AND if it isn't spared, how do
you propose to build your CW rig (e.g. assemble AND power the
your home made CW rig?

Let me suggest, that while you're building your rig, that the many other
"appliance" operators out there will already be providing emergency
comunications with equipment powered by battery, mobile installations,
etc. in many cases using repeaters installed with UPS (uninterupted power
supply) capability, etc.

Unfortunately, your suggestion about "the big one" indicates (at least to me)
that you have little knowledge of the extensive emergency communications
capabilities of the many governmental agencies (police, fire, etc.),
the telephone company (something I'm reasonably knowledgeable of) and the
ham community at large (especially those involved with RACES).

Interestingly, and I pose this as a comment and general question to
others in this newsgroup, I'm unaware of any CW practice drills being
done within my local (Morris County, NJ) RACES area. Are there any
RACES groups which do any type of CW operation as part of their
emergency preparedness drills and/or practice sessions?

PLEASE DIRECT ALL RESPONSES ONLY TO rec.radio.amateur.policy

2341. G5RV - A Rip Off

Newsgroup: rec.radio.amateur.misc
Date: 1993-05-11 15:44:53 UTC
From: epacyna@auratek.UUCP
Message-ID: <1105@auratek.UUCP>
Source record: 281815

While this is a popular antenna, numerous untruths and false claims have been propagated regarding its operation. The G5RV has no magical attributes. Even the article in the ARRL Antenna Compendium has many falsehoods. The G5RV is a 3/2 wave antenna on 20M where it presents a reasonable match to a 50 ohm system. On all other bands there is considerable SWR, and an antenna tuner must be used. The 34' section of open line does not entend the antenna lenght on 80M, or function as a proper matching section to match a 50 ohm system on the other bands. Those who have low apparant SWR's are simplely using a long run of lossy coax to mask the high SWR and wasteing power. Not only should coax not be used, and never use a ferite balun in high impedance circuit (very lossy).

For a limited space, 80 - 10M antenna , its more efficient to center feed the 102' horizontal with just ladder line all the way to the tuner. The tuner should be of the unbalanced to balanced type (i.e. Johnson Matchbox). Most of the commerical tuners are of the unbalanced type (L or T networks) and and fake it by hanging a lossy balun on the high Z output. Also the balun should be configured to produce equal current (not voltage as most do). Alternatively, you can build a balanced tuner and put a current balun on the low Z side as shown below.

```
--------------------Variable Inductor---------
Unbal. |
Trans- to bal. Variable Balanced
mitter current Capacitor Antenna
| balun |
| --------------------Variable Inductor---------
Ground
```

Note: Inductors are gang tuned. Balan is short lenght of coax with a lot of ferite beads over outside, or a lenght of coiled coax.

But you say I use a G5RV (or worked many others that use them) and they seem to work. Sure they work, but with compromise. Here's and example. Every time you half power, your signal reduces by 3 dB. So reducing your power to one quarter reduces your signal by 6 dB (or 1 S unit). So the average 100W station with 75% of the power going into losses will only be 1 S unit weaker. For casual operation, who cares. If your a QRPer, contester or chase DX, that one S unit makes all the difference in the world. Why pay for and install things that reduce your signal or can damage your expensive equipment (what happens when a misused balun burns up)?

Walt Maxwell in his book Reflections published by the ARRL is a must reading. His treatment on SWR, Baluns and the G5RV is lucid.

>You didn't say, did you call ramsey and try to resolve the problem with
>them? I've never purchased one of their kits but would certainly try to
>make a call if there was a problem. If you did call how were you treated.

My experience with Ramsey: my CT-70 frequency counter was missing some 1uF capacitors and a couple of resistors, and came with a micro-T case transistor replacing an MRF-910 (I think it was); there was no description of the pinout of the substitute transistor. I called them on the phone, told them what was missing, and asked for a pinout to know how to plug the transistor in. (I also mentioned that it seemed poor practice for them to use 1uF electrolytics to bypass an RF circuit!). They sent the replacement components, but no instructions -- in fact, they sent *another* oddball transistor (same type). I then assembled the kit using 1uF monolythics from my stockpile and a genuine MRF910 transistor after discovering that the micro-T transistor just didn't fit after bending the leads carefully enough not to break them...

Once that was done, it works well enough, but (1) it's very prone to internal oscillations on the higher frequency settings, (2) the battery holder inside is to be secured with double-sticky tape, which doesn't hold for long, and (3) the batteries don't tend to last long (not necessarily their fault, but perhaps they should have designed around C cells instead of AA). Also, when running from batteries they feed the +6V directly to TTL, which is not recommended for long life (I use a series Si diode to drop the voltage).

I gather that a lot of Ramsey kits fall in the "Well, it works well enough, I suppose, but gee it would have been easy to do better" category.

>the last Honda we will ever own...

Alternator whine pretty much comes with the territory in automobiles.
Mobile radios are *supposed* to take this out with filters and
regulators. But those components can go bad without affecting basic
radio performance. I had the choke part of the power filter in a
Kenwood TM-221A short out. The only symptom was a subtle but distinct
alternator whine in the receive audio. I cured it with a *deluxe*
alternator whine filter from Radio Shack. You might have a second
look at your radio.

Another "alternator whine" problem crops up when you lose the diodes
on one phase of the alternator output. This puts a *horrible*
low-freq buzz on both transmit and receive audio. It is detectable if
they test the alternator for maximum output, but it will keep your
battery happily charged and the "Alt" light off on the dash for years.

Of course, it goes without saying that you are connecting your radio
directly to the battery, right?

No code or not, I would never even consider joining an elitest organization such as yours. That attitude is contrary to virtually everything that Ham radio is all about. May your organization die a painfull death due to a lack of new members.

|>

I'll answer this one... We disconnected the radio in Faith's Honda from the car power system all together and powered it from a separate battery in the back seat. The noise problem persisted. The noise is DEFINITELY not entering the radio from the power leads. It's coming down the antenna feedline.

Another interesting datapoint: our other vehicle is a Nissan Pathfinder. Same radio (we each have FT-5200's in our mobiles). The pathfinder does not have trouble with noise from itself, but if I have it next to Faith's Honda and the honda is running, the same noise she gets in her radio comes into my radio. I have noticed this out on the highway as well, when passing SOME other hondas.

Honda does not seem to think it is worth their time shielding anything for emissions. They DO sheild their computers against outside RF getting in.

I've gotta wonder whether automobiles are subject to FCC Part 15 (at least for their computer components?). I have never seen an FCC Part 15 notice on any car, but since cars ARE operated in residential neighborhoods, they probably should be Class B certified.

|>

|> Of course, it goes without saying that you are connecting your radio
|> directly to the battery, right?

The radio is fed from the battery. I've looked at the power going into the radio with a scope, and it is reasonably clean. I did add the deluxe filter you suggested and that had some effect, but then we did the experiment with the separate battery (described above) and realized that we'd gotten all we were going to get by filtering...

>You didn't say, did you call Ramsey and try to resolve the problem with
>them? I've never purchased one of their kits but would certainly try to
>make a call if there was a problem. If you did call how were you treated.

I have purchased and built the Ramsey FTR-146, FX-146, and FX-440. There
were minor problems with each kit, too many or too few parts. If it was
a five cent resistor missing, I just picked it up at Radio Shack. But
for things like a varicap or a pot missing, Ramsey responded immediately
with replacement parts and an apology. The Ramsey FX kits have a distinct
advantage over anything from Japan. They can be EASILY interfaced to a
microcontroller or a personal computer. Given that, you can make them
do everything a Japanese transceiver can do and then some...KG7BK

Message-ID: <9304117371.AA737139276@sceng.UB.com>
Source record: 281817

Hi Carl --

I'm using a G5RV now, with mixed results. I homebrewed it from the "ARRL Antenna Book" (a different publication from the "ARRL Antenna Compendium").

I'd gladly provide details, or loan you the "antenna book" if you're interested. The standard flat top length is 102ft, altho some claim a half-length version is possible if you don't need 80m. I have seen specified lengths from 26 to 32 feet for the twinlead portion, depending on the characteristic impedence of the twinlead, typically 600, 450 or 300 ohms. I use 450 ohm.

I confess I don't understand it theoretically.

Practically, it seldom works better than my quarter-wave trap-vertical on the three bands that the vertical claims to support (10m, 15m, 20m). But, it is much quieter (better S/N) because most QRN is vertically polarized, and the G5RV is away from the house, not on top of it.

Often I hear that it "theoretically" requires that the tuner be at the point where the twinlead joins the coax. Unless you have a remote control tuner (?!) or can run the exact specified length of twinlead directly to the shack while maintaining the reqirement that the twinlead drop at right angles to the flattop, most people put a balun there and run coax to the shack, and put the tuner between the Coax and Transceiver..

It "tunes up" very easily on 40, 30, 20, 15 and 10, (the bands I've tried) to a low SWR. But I never know how much of the energy is really radiated and how much is warming the Coax dielectric.

I've already got one filter on there, and it didn't have much effect, if any. I've been loaned a really super filter -- and it didn't help, either. Our thought now is that there's some grounding missing someplace in the engine or in the body of the vehicle somewhere, and that I'm receiving the results of that missing ground (our prime suspect at the moment is the lack of ground strap on the hood). We just haven't had the time to get out our little sniffer loop and hunt down the noise. Yet another summer project... :-)

Hmm, curious. However, I've been told that there is absolutely no whine on my transmitted signal, so I suspect that this is not my problem. But I'll keep this one in mind for the future.

>
> Of course, it goes without saying that you are connecting your radio

>

Absolutely! This was what took us so long to get my radio installed, in fact, since there aren't a whole lot of places where wires can get through the fire wall in my car...

In fact, sometime about a year or so ago, I put out a request to the net for info on just such a problem. About 60% of the responses I got were "Wire directly to the battery!". Another 35% or so were "Ground the radio itself" (which we also did -- no effect), and the remaining 5% were

"Gee, my Honda doesn't do that" sorts and random others...

2356. Going about building your first transceiver??

Newsgroup: rec.radio.amateur.misc
Date: 1993-05-11 18:44:39 UTC
From: saswel@unx.sas.COM
Message-ID: <199305111744.AA01742@cardamom.unx.sas.com>
Source record: 281819

Now that I have had my license in my grubby hands for a couple of months
I would like to build a transceiver for 80, 40, or 15 meters covering
the novice CW portions of the band. I have never built anything before
and thus would need a very simple project to start off with (The only
soldering I have done has been in the making of wire antennas.).

The first obvious question is would it make sense to do something
simpler first or should I boldly dive into a transceiver project?
If the simpler project is the best way to proceed, what projects would
you suggest for a first time builder? Also, any suggestions on what
rig to build or the process involved in building the first rig would
be greatly appreciated.

I will summarize to the net the suggestions that I get and I will
give a report of my experiences during the building my first project.

Thanks - Warren (KD4YRN)

or SISTOR signal ?
I develop ms-windows base program to decode digital
signal such as MORSE, RTTY, DTMF using multimedia system as an
interface device. The only reference I got is ARRL handbook'93.
I'm a novice in this swl and scanning field, I don't
even know the use of CTCSS. I would prefer your suggestion
about what should be done to enhance the feature of this s/w.
The key of this engine is FFT which can detect any audioable
frequency that last longer than 4-5 ms.
If anyone interested in my program, send me an e-mail.
I'll send it to you by uuedcode.

Thanks.

clifto@indep1.UUCP (Cliff Sharp) writes:
First off, this was my post. At least the protions that you responded to.
I left out the other, intervening posts whereever I could.
So here goes:
: > Why is it OK for them to try to get priveledges on VHF but not on HF? After
:
: How about international law, one of those little items you were supposed
: to learn about to be granted a ham license?
:
As has been pointed out a number of times before, specifically by
Dana and Todd, the treaty doesn't require any speed standard nor even a
cnversational level of competency in Morse code. Second, it doesn't
require any code requirement, it recommends one but any signatory can opt
out by filing a waiver. This is how I understand it if you know otherwise
please let me know. I don't remember knowledge of internetional law being
part of the requirements for licensing! If you have a copy of the treaty
please send it to me.

: >all it wasn't that long ago that no-code meant no license. Why do you draw a
: >line at HF? It sounds to me like "I had to so should you." If that is the
: >standard you wish to apply lets not give anybody civil rights either, unless
: >they can recite the Constitution (I had to in school).
:
: Learn to recite some important parts of communications law instead. It's
: your duty as a ham.

Which parts would you like to hear? I do a pretty good job with part 97
(at least when I have my ARRL book in front of me :-) See Below

:
: >I don't see how a code requirement advance any of the principles of our service.
: > One of the purposes of the amateur radio service is to create a reserve of
: >trained electronics techs. I think you could make a case for more stringent
: >tech. requirements.: little bit bent out of shape. As for the opposition to the no-code
:
: 1: WRONG-O. 2: RIGHT-O. One of the purposes of the ARS is to create a
: reserve of trained RADIO COMMUNICATIONS TECHNICIANS. The electronics tests
: were MUCH more stringent in 1967, and my father passed the tests knowing
: next to nothing about electronics; the tests today are a joke. In Chicago,
97.1
(b) "Continuation and extension of the amateur's proven ability to
contribute to the advancement of the radio art."
(c) "Encouragement and inprovement of the amateur service through
rules which provide for advancing skills in BOTH the communication
and TECHNICAL phases of the art."

Yes the emphasis is mine. But you are probably right it says nothing about technicial stuff. How's that for reciting communication law? :-)

: I can hardly turn on the 2-meter rig on any day without hearing a chat between
: a pair talking about how the destination ham is going to solder a coaxial
: connector onto some coax for the driving ham. It's not at all unusual to
: hear questions about electronics on the air which are so simple, and
: indicative of absolutely no electronics knowledge, that they would make a

I didn't realize it wsa against the unwritten code to help other amateurs with solder jobs etc that they are unable to do for themselves. But you are probably right next time My friend Bill (no callsign right now) calls and asks me to solder something for him I'll tell him to get off his lazy blind ass and solder it himself. BTW he is studyingto get his license again. If you don't like that answer try:
Gee there really are some extras on 2mtrs. :-) There are people that don't know much about electronics of all license classes. Help teach them. Quit yer whining.

: second-WEEK electronics 101 student laugh. It's not at all unusual to hear
: people operating FM voice on 144.01 simplex (do you know the TWO reasons
: that's illegal?), or in the satellite bands or over a beacon.

duh.... I give up. I can't read the rule book. So tell us. Don't see anything wrong as long as this is A1A FM that is less than .01 Mhz in bandwidth. FM isn't defined in part 97, if we're getting picky, but hey Phone is. The simplex part was good though.

Of course your queston was really way too vague. I misread it the first time I thought you meant 144.01 Mhz. Now I see that you meant 144.01 Ghz (2mm band) I don't see any problems now go ahead and talk all you like.

: Let's try a scenario. The "big one" his Los Angeles. No power, no
: repeaters, most equipment is junk, no transportation, no phones, no
: communications. While you're still trying to figure out how to modulate
: a carrier, I'll be on the air, with a LEGAL transmitter in a LEGAL ham
: band, communicating with the outside world, because I can design, build
: and power a CW transmitter/receiver... and I can use CW.

Anything I own will be very well protected. If it's strong enough to kill my gear it will kill the components. Otherwise It better get the satellites 'cause I'll be passing traffic a little faster than 20 WPM. And the band conditions won't fade much, course the birds are only in the air 11 hours a day or so. If it's as bad as you are implying all ham bands will be legal. Part 97.403:
"No provision of these rules prevents the use by an amateur station of any means of radiocommunication at its disposal to provode essential communication needs in connection with the immediate safety of human life and immediate protection of property when normal communication systems are not available." (Can't wait for my CD with part 97. This transcribing drives me nuts) Oh look there I go again reciting communication law Gee.... thanks for the advice :-)

: >Do you mean a violent anti-no-code or pro-no-code stance?
: >Sorry I didn't keep up on QST until I became a ham in '91. If you mean
: >anti-no-code then I guess we can all grow and change with the times.
: >Growing should never stop.
:
: The ham world was violently against having a no-code license of ANY
: kind. By that time, the tests were so simple that the only thing anyone
: really had to work at to get a license was CW; some thought of that as an
: exclusion for CB junkies effortlessly easing their way into our midst.
: Still others had been through situations where CW was the only way they
: could communicate with others at one point or another and realized the
: value of knowing CW. Yet more others realized that, to talk to people
: in poorer countries where ham gear is/was frequently homebrew junk that
: could only operate CW, we couldn't fulfill one of our mandates (that of
: enhancing international relations with people of different countries)
: without being able to talk CW with them, or at least understand what they
: were sending. And finally, most all hams knew back then that it was (and
: still is) international law that amateurs licensed to operate below 30
: MHz had to demonstrate proficiency in the Morse code.

Many people are violently against the right thing look at the freedom
riders in the south. I'm not drawing a direct comparison but realize that
just because a majority of a group want something to happen means that is
the right thing. How does exchanging Q signs with
another ham further international goodwill? Other than that would require
a common natural language or at least espranto! Again with the
international law! please see the rebuttal above.
I never mentioned CB but as longas you did... When I was a kid we had an
old Johnson in our car. It was great, had one of those telephone type
handsets.

: Wait... let me think. Getting more CBers into the ham bands... not
: being able to communicate under certain circumstances... degrading
: international relations through removing a form of communications with
: hams in other nations... violating international law... yes, that IS growth.
: Sorry I carried on so. I take it all back.

I didn't know you could communicate under all circunstances. I'm really
impressed! I won't even go into finding exceptions to that one lets just
start with sleeping.
: > One of our others duties is to train pro. quality COMMUNICATORS. :
: "Other" duties? (See above.)
Yes other duties, see above or part 97.1

: >We don't need a morse code proficiency test to keep the ham bands from turning
: >into a mess like we see on CB. What we need to prevent that are a bunch of
:
: No, we have that fantastically difficult technical test to pass.

Keep up with the thread please, this has been addressed before.

:
: >amateurs that care enough to help others out and show them what being a good

: >operator is all about. But looking at the mess ours bands are already in I guess
: >that is not very likely to happen. In my brief time as an amateur I have
:
: Part of the reason the bands are in the shape they're in now is the
: long history of relaxing the requirements to get a license, or to upgrade
: to a higher class (and thus more privileges).
: If you're convinced that being helpful and showing others what good
: operating techniques are will improve things as the licenses become
: available for two Cocoa Krispies boxtops, try your theory out on CB
: channel 9 for a bit.

I would bet that if the FCC gave some people authority to do something
about the problems they would get better, especially if the Hams were
given privledges there again. That way we'd out number the lids. And a
few pink slips and some good RDF cleans the bands up pretty well. A
friend who was a CB'er before entering the amateur service (N6VTC) once
tracked down a jammer and teh problem went away almost immediately. Of
course the sudden appearance of 10 cars in front of his house probably
helped too :) Here in Davis, CA I've heard that CB is pretty clean. My
problems aren't with 2m locally but with 440Mhz. A couple 70cm machines
have people who like to rebroadcast FM radio. (illegal, stupid and allowed
by the control op) Who is an extra that breaks regs. on his autopatch
almost every day. Calling professionals and setting up appointments all
the time. He does ID sometimes though. 2m is really nice around the
Sacramento Valley though.

:
: >elmered four new no-codes into amateur radio. (my girlfriend is number 4 and
: >her license should be in Thursday's mail) They all know how to *operate* their
: >radios. They all help keep our local spectrum from looking like CB. They have
: >all participated in public service events, (my girlfriends first will be May
: >15th) they can all make a dipole and none of them whine.
:
: Now THAT is something constructive. Keep that up and prove people like
: me wrong.
:
: > I would rather hear a bunch of appliance operators who are coureous and
: >put out clean signals than some idiot who splatters all over the band and
: >care where he/she tunes up, tries to throw people off 'their' frequency because
: >'I always have a sked here' It is always the courteous operator, or usenet user
: >that get listened to, not just the one who is heard most loudly.
:
: Oh, I see you heard about CB channel 9, eh? Must not have listened, though,
: because 5 minutes is all it takes to show that the one heard most loudly
: (usually screaming "Walk walk walk on you" or something about excretory
: functions) always overcomes the courteous, clean-signaled one.
: I reiterate; there's little to keep that loud, splattering lout off the
: ham bands any more. When enough of them find that out, courteous operating
: techniques and good example ain't gonna help. Try this simple quiz:

Sorry, but no I haven't even turned on a CB in over 5 years. No they
don't always overcome the courteous ham. Wouldn't it be nice if in the
middle of a pile-up an operator said N5... Please stop transmitting on my
frequency during an exchange. I will not respond to you today.
Big bad lout won't get his QSL card. Same thing can work anywhere on the
bands. If no-one talks to you why transmit? This may not work so well on
sats. though they can still listen to themselves. (quite an investment
just to annoy others though) They are just idiots you surely can outsmart
them. If all else fails use A1A they probably have forgotten morse since
their 1C exam.

: The easier the test for a driver's license gets, the worse the drivers
: on the road get and the more bad drivers get on the road.
: The easier it is to pass through grade school, the lower the SAT scores

Dan

BTW I don't remember ever saying that ALL morse code requirements should
be removed. I do think we need to understand that it really adds nothing
to the state of the art and is no more important than SSB, FM, AM, SS,
AMTOR, RTTY, Packet, ect. I don't think we should forget to test on these
items either. A1A is an emmission type not a religion.

:
: Thanks for any comments

I think you are alright with this. I believe this is treated like
any other third party traffic. Which means that it is approved for
domestic contacts and Dx contacts with stations in countries that have 3rd
party agreements with the US. I think there is a list of 3rd party
nations available via the ARRL mail server, but I'm not sure. Not only
can an unlicensed individual send a packet while you are at the keyboard
they can also mail the packet to you and you can pass it on from the
internet to ampr. There are a couple people who provide just such a
service on the 'net. I don't have the information here now but e-mail me
if you want more info. Keep up the good work. We can use all the GOOD
hams we can get.

:
Kevin,
If you get no help with finding the programming codes yourself
just take it back to the place from which you purchased the phone and ask
them to remove it. They get a kickback of a certain percentage ofyour
phone bill from you cellular provoder. If they wont do it remind them of
this. If that doesn't work go to a competitor and tell them you'll let
them "churn" you if they will remove the offending ad. They not only get
a % of your bill but also a bonus for getting you to sign up in the first
place. The numbers are 3% of you monthly bill and $150-$200 for sign up
in Southern California. I am sure they are similar though probably
slightly lower in your neck of the woods.

> ---
> ! !
> -------------
> ! !
> -------------
> ! !
> ---

Similar idea: Put a wooden dowel of a diameter equal to the insdie
diameter of the PVC pipe inside the pipe. (That didn't sound so good,
did it?) Besides keeping the pipe from bending, it'll keed it from
snapping.

I have used this method on a 8 foot mast of a 3 element 2m beam supported
by a 4 legged 'tripod'. ("quadpod"?)
(The mast, pod, and boom of the beam are all PVC.)

PVC is GREAT for small antenna use! It's cheap, can be made realativly
strong, has lots of neat connectors, and is easy to cut. Also, backpackers/
hilltoppers will appreciate the fact that beams, etc can be designed to
break down (at connectors, corners, etc) to fit their packs. ie. sit flat
and not take space in all 3 dimensions.

I have also seen this. Someone explained to me that these modules were
not orignally designed to be linear amplifiers. They found that the
"-2" part was more linear in the desired frequency range than the "-1"
part. This is why the "-2" part was used. Or was it that the "-2" part
was readily available and the "-1" part was a special order? I can't remember,
sorry.

>
> I also have a question regarding the output level of the TXA5

> level specified for the device?

I beleive that this was due to the non-linear nature of the MHW-710 parts.
By limiting the drive power, the device was being used in its linear region.

You might try using a SAU-4 instead. This device is very similar to the
Motorola part, but is a linear amplifier.

2366. Yaesu 747/Icom 728 Comparison

Newsgroup: rec.radio.amateur.misc
Date: 1993-05-11 20:53:29 UTC
From: Charles.R.Hohenstein.1@nd.edu
Message-ID: <Charles.R.Hohenstein.1-110593155023@mac23.debartolo.lab.nd.edu>
Source record: 281732

I am considering both a Yaesu 747 and an Icom 728 for a first HF rig. So far the extent of my reasoning has been:

Both rigs have general coverage reception, noise blanker, -20 dB attenuator, and squelch. Output power is the same. Neither has a notch filter. Both require optional modules for FM. Both seem to be capable of computer control. Weight and size apparently are comparable. So none of these factors helps to distinguish the two rigs.

On the plus side for the Yaesu is the provided CW filter. On the plus side for the Icom is passband tuning and a built-in pre-amp. The Icom has 3 IFs as compared to 2 IFs for the Yaesu, but probably this matters less than the actual implementation of the design. It appears that the cooling system for the Yaesu may be superior. Accessories for the Icom seem to be more plentiful, but I'm not sure I would use them. Also, I have heard that Icom service has been a problem for some.

If anyone can add to or correct my impressions, especially as based on actual use, I would be very appreciative. The above is based on literature I have been able to collect, and I have not had the chance yet to examine either unit (no nearby dealers).

But learn it as dah-di-dah-dit (for C).

Use "di" and "dah" except when the "di" is at the end of a character.
Use "dit" only at the end of a character.

There's no problem in understanding what's meant if dit is used in all instances, but following the guideline above makes the di-dah rendered morse sound better when spoken.

This is an age old red herring brought up every time someone feels a need to justify forcing everyone to learn CW as a means to saving their lives. It's similar to the "you've crashed in an airplane and the microphone on the radio was destroyed" argument. As for the ease of building a CW transmitter, I'm sure I can build an SSB or FM transmitter as easily out of the random parts in my shack as Cliff can build a CW transmitter out of the parts in his. Heck, I have chips that are nearly a complete FM transmitter. Add a few discrete components and you're on the air. Carving a piece of quartz and pushing a wire onto germanium are a thing of the past.

From: oo7@emx.cc.utexas.edu
Message-ID: <1sp9c5INNqvi@emx.cc.utexas.edu>
Source record: 281738

gary@ke4zv.uucp (Gary Coffman) says:

>>I decided to do a little empirical research in response to this. I selected
>>two 350 kHz frequency segments, 14.000-14.350 and 146.61-146.97,

>>Now let's look at how the 20 meter band broke down. In the
>>Extra CW segment there were 3 signals heard in QSO.

You must have a cruddy receiver, very poor ears, or did this test at
3 a.m. after a solar storm with the antenna disconnected. I have never
heard as few as 3 stations in any 25 KHz on any HF band except in those
conditions.

I suspect that you do more listening on 2m than you do in the Extra
CW segments. We don't do loud cross-town chatter down there. Signals
are generally much weaker and you need to turn up the RF gain. With
a half-decent receiver you are unlikely to find the above results, and
it can take many minutes to tune through just the Extra segments to sort
out what is there.

It is amusing that a while back someone commented that the CW bands were
so crowded that he could not find anywhere to call CQ (and this was not
during a contest) and the only spaces were in the phone bands. I suspect
both of you have some preconceived ideas that influenced your findings,
since both of these statements are very far from the truth. Since I am
completely bias-free, I can set you both right at the same time...

2375. Help for white stick op (tuning meter)

Newsgroup: rec.radio.amateur.misc
Date: 1993-05-12 00:06:16 UTC
From: df@wsbbs.demon.co.uk
Message-ID: <737183014snx@wsbbs.demon.co.uk>
Source record: 281756

Hello
I wonder if anyone out there can help, or can point me to a possible source of help?
I am a white stick op (totally blind), and until recently used an audible SWR bridge to check my HF transmitter/antenna. A fault has developed on the unit, and I have no circuit or other info to help with the repair. The SWR bridge was manufactured by a UK firm, WPO Communications, who I believe are now out of business.
I wonder if anyone has any info on this unit that might help, or any info on an audible meter or digital meter with synthesised voice output that would allow me do any of the following without the need for sighted assistance:
1) check that my SWR into the antenna is as it should be;
2) make adjustments to (tune) my vertical multi-band antenna.
A friend of mine has set up my antenna initially using a digital antenna analyser meter manufactured by MFJ. Does anyone have any information as to whether such a meter might be adapted with a voice chip to make it usable by someone without sight?
A long time ago - in the 'fifties and 'sixties - there was an organisation called Science for the Blind that produced tactile and audible meters for tuning the old valve transmitters. Does anyone know of any firm making anything at all suitable for use by a blind ham?
Any help most appreciated.
73 de Den, G3VSH (reply G3VSH@wsbbs.demon.co.uk or on Amtor/packet to G3VSH@OH2BAR).

>> [My suggestion to use a Radio Shack filter deleted]

>I've already got one filter on there, and it didn't have much effect, if
>any. I've been loaned a really super filter -- and it didn't help, either.

I read Dan's post about trying filters and then, eventually, running
the radio on an independent battery and determining that the noise was
definitely coming in the antenna.

One thing is that we have our terminology crossed. Alternator whine, to
me, is an almost-pure audio sine wave whose frequency rises and falls (from
about 200 Hz to 1200 Hz) that is superimposed on the DC power line.
It is really the ripple from the 3-phase alternator rectifiers that is
not being adequately filtered by the "capacitance" of the battery, usually
due to small wiring and connector resistances between the alternator
and the battery, or a bad battery. It has an amplitude in the millivolt
range, but a source impedance in the micro-ohms. Or so it seems.
Brute-force capacitance has absolutely no effect on it. You have to
have at least one L-C section to make a dent in it.

>Our thought now is that there's some grounding missing someplace in the
>engine or in the body of the vehicle somewhere, and that I'm receiving
>the results of that missing ground (our prime suspect at the moment is
>the lack of ground strap on the hood). We just haven't had the time to get
>out our little sniffer loop and hunt down the noise. Yet another summer
>project... :-)

This is the right approach. I have this sneaking suspicion that the
source of the noise may not be the alternator. But, whatever it is,
the cure will be to filter out the noise at its source. The alternator
is easy to filter at VHF - use a coaxial capacitor in the output lead,
bonded to the alternator case. And make sure the bolts holding the
alternator into its mount are tight all the way back to the engine
block.

But if it is the engine-control computer, as I suspect it is, all bets
are off. The only thing I could suggest is to look for a chassis
ground *real close* to the computer and bypass every wire going into
and out of it with a .001 mF disc ceramic capacitor with extremely
short leads. And I think that it goes without saying that this will
absolutely void your warranty.

I wrote:
>> Another "alternator whine" problem crops up when you lose the diodes

I just mentioned this as a long shot. It isn't the problem.

>In fact, sometime about a year or so ago, I put out a request to the net
>for info on just such a problem. About 60% of the responses I got were
>"Wire directly to the battery!". Another 35% or so were "Ground the radio
>itself" (which we also did -- no effect), and the remaining 5% were
>"Gee, my Honda doesn't do that" sorts and random others...

These are excellent statistics for an instance of net.advice :-)

>"I'm afraid I don't know very much about Romulan Disruptor settings"

Geez, you don't have one of *those* under the hood, do you?

Filter performance is usually less important than shielding. Make sure that the coax between the transmitter and filter is good quality (at least 95% braid coverage) and be sure that the shield braid is well-soldered over the entire 360 degree circumference of each connector shell. Even better, connect the filter to the transmitter with a double-male connector (a right-angle connector may be most convenient).

One reply posting says you have to bond the filter chassis to the transmitter chassis. This is not necessary if the connecting coax is good.

Obviously the filter power-handling capability must be at least equal to your maximum transmiter output power. High SWR can degrade the power-handling capability of the filter. For this reason, if you are using an antenna tuner, always adjust the tuner with the amplifier turned off (or with exciter power turned down, if using a low-power-rated filter).

I use one and it's worked well. Mine is exactly like the one in the ARRL Antenna book, though I use Teflon (tm) coated wire. I feed it with 450 ohm twin-lead ladder line, and paste that to buried RG-8 type coax to my shack. It works with the automatic antenna tuner in my TS-44S/AT. I have worked many countries around the world with it (and 100 watts) and have the absolutely loudest signal on the NJ Phone Net (3.950 at 6PM Eastern Time) every nite! Ask anyone!

I don't know why it works either, but as a compromise antenna, it can't be beat. There have been MANY articles written about it, and many derivative designs (the doublet and Carolina Windom are related) but I swear by mine. Sure, I'd rather have a Yagi or a quad, but for a few bucks and ease of installation/repair it's great.

Best 73 to all!

2380. ARSENE software on UCSD for FTP

Newsgroup: rec.radio.amateur.misc
Date: 1993-05-12 00:42:57 UTC
From: f6bvp@f6bvp.frpa.fra.eu
Message-ID: <1sph6h$k15@network.ucsd.edu>
Source record: 281746

Files TELEM14G.ZIP and TELEM14H.ZIP are the english version of ARSENE
satellite real time telemetry decoding programs. They concern packet
radio and work under DOS.
Files TELEM14G.UUE and TELEM14H.UUE are the same files ASCII transformed
using UUENCODE program version 4.02.
A small bug in previous version concerned RTS signal preventing some
packet TNC to be initialized by the program. It is now fixed and
these versions should work with any TNC.

73 de Bernard, f6bvp@f6bvp.frpa.fra.eu
and f6bvp@amsat.org

::::::::::::::
/var/spool/ftp/hamradio/arsene/telemeng.txt
::::::::::::::
Hello Brian,

Files TELEMENG.ZIP and TELEMFRA.ZIP are the english version of ARSENE
satellite real time telemetry decoding programs. They concern packet
radio and work under DOS. Here are the first lines of documentation
file.

T E L E M
version 1.4e

ARSENE satellite telemetry decoding package
by Frederic Rible fc1oat @ f6abj.frpa.fra.eu
(documentation for version 1.4e by Bernard Pidoux, f6bvp)

This software is distributed free of charge by:

ATEPRA
Association Technique pour l'Experimentation du Packet RadioAmateur
23, rue de Provins
F-77520 Mons-en-Montois
France.

If you want to support ARSENE project you can send your donation to ATEPRA
or RACE association.

ARSENE is a mini satellite built by french RACE radio amateur organization.
Its mass is 158 Kg and its orbit 20 000 - 36 000 Km with zero degrees
inclination. The output power is 15 Watts on VHF.
It has three AX25 standard 1200 bauds AFSK FM packet transponders with three
uplink frequencies on 435.050-435.100-435.150 Mhz.
The frequency of the downlink and of the AX25 beacon is 145.975 Mhz.
This beacon will send telemetry giving the status of radio modules

and electrical equipments aboard the satellite.

Hardware requirements for copying the telemetry in real time:
A VHF FM receiver, a standard packet Terminal Node Controler with no special modem (i.e. bell 202 standard) a PC with serial port connected to the TNC using 8 wires (wires 2 to 8 plus wire 20). Signal strengh should make ARSENE easy to copy with a 145 MHz yagi antenna with 13 dB gain. Although signal is transmitted with vertical linear polarisation, a circular polarisation receiving antenna could be better.

This real time telemetry decoding program will run with any color graphic adaptator. The monitor can be black and white but, of course, full colors effects will not be performed unless a CGA, EGA or VGA monitor is used.

Hello DXers,

I heard that SONY has a receiver out, called ICF SW-77
(or is it just SW77)? I saw a picture of it in an ad in WRTH'93,
and it's priced about $100 more than the SONY 2010...

I wonder when the receiver came out, whether it is superior to
the 2010, etc. More specifically, has the receiver been evaluated or reviewed
in any recent publications?

I remember that Larry Magne wrote detailed reviews of receivers for
"Radio Database International"-- do they have a review out for the SW-77?

Any or all info on the receiver will be gratefully monitored
and logged!

>DEFINITELY not entering the radio from the power leads. It's coming
>down the antenna feedline.

I responded to Faith that stuff coming down the antenna lead isn't
what I call "alternator whine". Alternator RFI, maybe.

And if that is what it is, Radio Shack sells a kit with a coaxial
capacitor in it that you could put in the output lead of the
alternator. But, as I said to her, I think it's something else that
kinda sounds like alternator whine, but isn't. My chief suspect is
the engine control computer.

>Another interesting datapoint: our other vehicle is a Nissan
>Pathfinder. Same radio (we each have FT-5200's in our mobiles). The

That's an excellent point. However, looking at the political fights
that crop up whenever someone suggests that consumer electronics have
RFI shielding, I wouldn't hold my breath.

>The radio is fed from the battery...

Yeah, you've eliminated any possibility of power-line noise.

From: CPDVAX::DUBE 11-MAY-1993 20:25:51.97
To: INFOHAMS
CC: DUBE
Subj: No-code stuff

It seems like this just isn't going to go away! But let me relate this:
I travel quite frequently, from coast to coast. I always take along my
IC2SA and ask for the highest room I can get in hotels where I stay. Then
I try to tune in to all the repeaters to get a handle on what's going on.
Here's what I've found:

In general, there's excellent discipline everwhere I've been. I know I
don't hear much in my short visits, but what I have heard speaks well
of Hamdom; and I'm sure that a lot of who I've heard and even talked to
are "no-codes". Sure, there have been a few burp-in-the-mike idiots
here and there and probably some of them have been no-codes. But some
of them may have been Extras, too!

On a recent trip to DC I heard a busy, but well-controlled repeater during
and after rush hour. It could be a model. I bet there were a number of
no-codes on it, too.

I expect that, sooner or later I'll run into a repeater or an area where
things are sliding downhill toward CB-ism; but then, the owner of the
repeater can either condone it or close down.

I guess if I had one complaint it would be that a lot of places don't seem to
bee overly friendly toward "alien" calls. Thee have been a few places where
I simply could NOT elicit a reply from any listening station, even though I
was able to hit the repeater well. And there are a scattered few who, even
though they may answer a call, act as if they wish you'd go away.

hobby (be it eliminating Morse code or any other method), my experiences haven't
borne out the "no-codes are the ruination of the hobby" notion.

All those with CW privileges do have one big advantage, though, if they feel
so strongly about it: They can escape to the spectrum below 30 mHz. where
they won't be bothered by the no-codes.....

>not see it posted here. I've been told that it is also in news.groups
>and a few other places. Whatever your disposition towards this proposed
>reorganization, I encourage you to vote on it.

One single copy was cross-posted to news.announce.newgroups, news.groups,
rec.radio.amateur.misc, rec.radio.amateur.packet, rec.radio.amateur.policy,
and rec.radio.info. Your newsreader software probably noted that you saw it
first in r.r.a.packet and didn't display it again in the other newsgroups.

It looks like it made it OK. It arrived at my site properly cross-posted
to all the required groups. We talk directly to UUNET so, with only one hop
from the moderator of news.announce.newgroups, there wasn't much room for
problems to occur.

Anyway, thanks for speaking up when you thought there might be a problem. I'm
glad to help clear it up.

I think I hold the "bad luck" ticket record. I took the novice/tech tests at the same time and passed both. I sat around for 5 months and neither showed up. I called around to find out why and the Cavec guy in Montgomery AL had my forms sitting on his desk for the whole time because I didnt put the zip code on the station address (it was on the mailing address and could have been filled in) He said he tried to call me all summer but couldnt get me. Unlikely, I was home. A total of eight months and I got my tech ticket in the mail.

I had no problems with general BUT I passed my advanced at Birmingham Ham fest and NEVER receive my ticket. I tried to get in touch with several BARC members but had no luck. I had also lost the proof I passed the test since it was another eight months before I started looking seriously for my ticket. This weekend I plan to try the BARC and B-ham cavec guys again and pass my advanced for a second time! I would imagine that it was cavec that screwed up again and I think they need to get their act together.

If there is any one with a better story let me know. I would like to think I am not alone.

>studying the code after I get my ticket.

I can't specifically say, but I believe Tony is proposing to restructure
access to V/UHF bands by license class, i.e. the non-coded tech would have
all frequences below 147.00 on 2 meters, and coded techs would only have
access above 147.00. This would give non-coded techs an "incentive" (remember
that folks, that's what our licensing system is supposed to have...) to
upgrade beyond no-code.

> because of the $$$. ARRL does not represent a majority of hams anyway.
^^^^ ^^^^ ^^^ ^^^^^^^^^ ^ ^^^^^^^^ ^^ ^^^^ ^^^^^^
Well, Mr. O, it seems you have a great deal to learn about the
workings of the rest of the world, outside the rather tightly and
hermetically sealed state of mind called Rhode Island. Had you stated
your premise that the majority of licensed US hams were not members of
the American Radio Relay League, you'd have been correct. However, as
far as the Federal Government (US) and the various International
Governments who collectively make the world-wide rules... The ARRL
IS the representative body for US Amateur Radio. Hands down. No
arguement. NO COMPETITION. The ARRL is THE representative body.

Now, this may rankle you, but it is just the facts. In order to change
this, you will have to a) develop a competitive representative body and
get all the governments, including the FCC, to recognize your group
instead of the ARRL; or b) join the ARRL, vote, elect people who
support some of your opinions and feelings and make your changes from
within.

As an Old Buzzard, who has been around this pole a helluva lot more
often than you have in your tender 24 years on the planet, I think you
are way off base, and your sample of hams which you pulled out in a
previous post to argue with Mr. Levin, is deeply flawed: you only are
citing the opinions of people who hang around with you, and any fool
can see that your rather loud and belligerent manner would tend to
tilt the bias in favor of your opinion... ;^) Nothing wrong with you
hanging around with people who agree with you, but that doesn't
exactly make for any sense of a good sample... go broader...out of

RI... ask LOTS of hams who have been licensed since BEFORE the
incentive licensing program nearly made us all extinct...and check
your percentages again....closely...people with memories and no desire
to repeat the stupidity of 1968 are pretty well in favor of the
licensing scheme that permits licenses without a CW requirement...
that these new hams are upgrading, at the rate of nearly 2 of every 3,
should take a great deal of the arguement out of you.... but like so
many who like to believe they are educated because of a college
degree... you will no doubt sputter on, further proving ignorance is
no filter for anything...

I STILL don't know why I did that... but, I FEEL so much better! ;^)

2394. Ray Stilwell?

Newsgroup: rec.radio.amateur.misc
Date: 1993-05-12 03:19:30 UTC
From: brown@odin.ins.cwru.edu
Message-ID: <1spqc2$8fu@usenet.INS.CWRU.Edu>
Source record: 281735

Am looking for information for the following person... he is a friend
of my dad, though they have kinda lost track of each other. My dad has
been unable to get current info about him for a while.

The guys name is Ray Stilwell, his call is WA4MLD. He used to be at
the address listed in Buffalo's call sign server, but that info seems
to be a bit out of date.

The callsign server says this:

Call-Sign: WA4MLD Class: ADVANCED
Real Name: RAY W STILWELL Birthday: MAY 14, 1940
Mailing Address: 519 S SECOND ST, FORT PIERCE, FL 34950
Station Address: SAME AS MAILING ADDRESS
Valid From: OCT 27, 1987 To: OCT 27, 1997
Records Last Processed: OCT 27, 1987

If you have any info, send email to x1rbrown@exnet.iastate.edu (Roger Brown,
ND0J) or myself, brown@ins.cwru.edu (Dan Brown, Call Sign pending)

Thanks.

Dan

BTW, Has anyone seen a letter from the FCC with my name on it??? Am waiting
for a Tech plus ticket... Its been six weeks, so hopefully it won't be much
longer!!

Another sneaky little noise source to look out for is, believe it or not,
the dimmer for the dashboard lights. I ran into this on a '77 Accord with
some audio equipment. The dimmer was a switching circuit, and probably didn't
have much in the way of RFI suppression. A fast edge with a 12-volt swing
and lots of wires to radiate from can get into everything. Seems to me I've
observed this on a recent model Prelude, too. The thing that made this
source strikingly obvious was that the pitch of the whine was directly
adjustable with the dimmer knob.

Of course, this would only show up with the lights on, and the correlation
with engine speed is less pronounced than in the case of alternator noise.
(I think there was still some correlation because of variations in the input
voltage with engine speed.)

I don't remember if you stated any of the following earlier in this thread,
but:
1. Is the frequency of the noise in fact directly correlated
with engine speed?

2. Does the frequency or amplitude of the noise depend on other
loads (lights, fans, etc.) beyond effects due to engine speed?

I think you should be able to run the engine just fine for a little bit
with the alternator drive belt disconnected. This should answer the question
once and for all whether the alternator is or is not the source.

I have here a good amount of coax marked "Certified Quality RG 213/U MIL Type". Recommended it to a friend, as it came from a well-regarded antenna dealer in the area and wasn't too expensive. Had to troubleshoot his installation, expecting to find he installed his PL-259s wrong or something. Ended up cutting the stuff into sections and found that about 20' of the 100' he bought was dead shorted; the extruding machine had misguided the center conductor or something, and all the foam insulation was on one side of the center conductor, pushing it firmly against the braid.
If this is the stuff he's thinking of buying, I'd take big and inflexible and hygroscopic any day. When it comes to it, by the time I replace this junk coax, the 100' I end up with will have cost me about what inexpensive Heliax (if there is such a thing) would have cost. (I'm sure the dealer would have replaced the bad 100'... with more of the same junk.)

Source record: 281764

I'm looking for info on how to program a Motorola MT-2000 HT into the ham bands. It's a UHF radio, no keypad. The software won't let it go below 450MHz, and I'm wondering if there's a fix for this.

Please email and I'll post a summary.

Indeed!

Although I would have to say that the recent writing of a one Rev.
Michael P. Deignan (kd1hz@anomaly.sbs.com) makes even the most demented
postings of a certain nameless net personality look like the oversexed
ravings of a freshman who found a terminal logged in to someone else's
account. Just like the widespread suspicion that Madelyn Murray O'Hare
was a fundamentalist plant designed to discredit atheism, I have to
suspect that the Reverend is a similar plant of the CIA/FBI/
MotorolaCellPhone/Whatever designed to discredit amateur radio. It's
the only logical explanation.

Incidentally, regarding the dethroned net personality, I have an archive
of interesting sparring between this individual and the late, great,
Larry Lippman in sci.electronics. It's rather long, although I could
be persuaded to post or E-mail it. Plenty of "pay no attention to that
man behind the curtain" to be sure...

Followups to alt.flame where they should smoulder quite nicely alongside
Rosebud the sled...

>rig to build or the process involved in building the first rig would
>be greatly appreciated.

While good receivers are easier to build today than in the past, I'd suggest you build a simple transmitter first and use it with a commercial receiver before embarking on the transceiver project. While there are a good number of solid state designs in the Handbook and DeMaw's books, I think everyone should experience the warm glow of vacuum tubes at least once. A good starter rig would use a 12AT7 as oscillator/buffer, and a 1625 as the PA stage, see the 1962 Handbook. This would be capable of running 50 watts on the Novice bands. There's nothing tricky about this design, and it could even be built "breadboard" style as in the old days. You'd still want to package it in perforated metal, available at the hardware store, for shielding and electrical safety, but you could avoid having to learn chassis punching and other complex metal work by building the actual circuits on a plank.

If you'd rather build solid state on circuit board, there are a number of designs available in the 1 to 5 watt range that have appeared in QST and elsewhere. FAR Circuits among others offers bare boards. Solid state is less forgiving of errors than tubes, with a single slip meaning new devices, but the low voltages are safer for the novice builder. Once you get into higher power, the high currents used in solid state rigs can be hazardous however.

On the receiver front, single conversion superhets and DC receiver designs abound in the literature. Taming the high gains involved in these designs can be more frustrating than dealing with the relatively low gains of a transmitter's stages, however, and probably should be reserved for your second or third building project. There are single chip designs such as those using the 602 that can make receiver building easy, but the challenge is low and skills learned small from such an approach.

I'm assuming you have, or have access to, a commercial receiver or transceiver. That's the single most valuable bit of test equipment you can own, other than your brain, for RF building projects. Think of it as a service monitor that can measure frequency, relative signal strength, and, in the case of a transceiver, act as a signal generator. Trying to work without one is possible, many thousands of hams in the past have built their entire stations from scratch, but it certainly makes RF experimentation easier and more certain to have one on the bench.

Hi all;

I am moving to Beijing in the near future, and find myself asking...
"Can I operate in China?" I know that (at least in the past) this
would have been impossible (OK, highly illegal), and it appears
that even reasonably sophisticated receiving equipment would have
not gotten through Chinese customs.

But now, with some serious "loosening up", perhaps the ban against
amateur operators has been lifted? Anyone out there know anything
that would indicate I should pack up the Yaesu?

Was this for Novice class or higher? My understanding was that Technician licenses (and upgrades) take longer to issue.

Why do I care? 'Cause I just passes my no-code tech test monday! (Had to say that!). Now maybe by the time I get my call I will be able to afford and HT!

Airwave auction bill advances
New York Times News Service

WASHINGTON -- The House Energy and Commerce Committee overwhelmingly approved a bill yesterday that would allow the government to auction radio frequencies for the first time. The frequencies will be used for advanced wireless telephones and other new technologies.

The bill, which has heavy support from the White House and is given strong chances of becoming law within the next few months, would bring about a significant change in how the government manages the airwaves.

Licenses to use the radio-frequency spectrum -- whether for traditional television and radio broadcasts or for more specialized uses such as cellular phone networks -- are collectively worth billions of dollars.

Until now the government has awarded the licenses either through lotteries or a long process in which competing applications are evaluated in hearings.

The bill, which the committee approved 36 to 8, would allow the Federal Communications Commission to award licenses to the highest bidders and turn the money over to the Treasury.

The bill would primarily affect licenses for "personal communication services," an emerging family of technologies that includes everything from Dick Tracy-style wristwatch telephones to palm-size computers and electronic notebooks that communicate over the airwaves.

The FCC is in the process of allocating a broad band of frequencies for the new services, and it hopes to begin assigning licenses by early next year. The bill approved yesterday would require the FCC to start issuing licenses within nine months of the bill's enactment.

It would also order the government to make available for new commercial technologies a big block of frequencies now used by federal agencies. The federal users would either be moved to other frequencies or would adopt nonradio technologies.

The Congressional Budget Office estimates that auctions of the radio spectrum could raise $7 billion over the next five years; the measure approved yesterday will be incorporated into the House's overall budget bill.

The Senate is working on a similar measure. Although details of the Senate bill remain up for debate -- such as whether to give special treatment to

rural telephone companies -- the broad outlines of an auction plan seem all but certain to pass.

Support for auctions has increased markedly in the past few months, partly because of prodding from the Clinton administration and partly because of unhappiness over the lotteries. A wide range of critics long have contended that lotteries merely reward speculators, who apply for licenses and then resell them on the private market for a quick profit.

I bought one of the 180's a couple of months ago...it quit working a week after I bought it...but that's not the problem HRO would have been very happy to replace it if I had wanted another 180. The Alinco 180 is very short on features (thus the lower price) features that you will wish you had after its in your hands. No keyboard frequency input, no S-meter, only 10 memorys, you can't plug 12 volts into it... you have to buy an adaptor. I know none of these sound like big deals but if you buy any HT without these features you'll wish you had them later.

Just my thoughts on the subject...when the 180 broke I replaced it with an FT-470. It has worked flawlessly.

>
>Cecil_A_Moore@ccm.hf.intel.com at Internet_Gateway
>

Well I was going to stay out of this..but

I purchased a ft146 and the cabinet kit. I really liked the way
the kit went together and especially the manual and how you
got to test various sections as you completed them.

First, parts wer missing, some parts seemed real high quality.l.
some were out right garbage

I put it toggether and tried to follow the alignment procedure. I
couldn't get it to work.. had a Masters level EE major help me... turned
out the crystals were off freq. and the coils needed to be stretched
way past what they suggested.

I called Ramsey and got their technical support person who informed
me that they had gotten a large number of bad crystals from the
manufacturer and since they were stuck with them, I was stuck with them.
He gave me a procedure to bring the crystals on freq... well ti didn't
work..but my friend was able to bring them close enough to get the
radio to work

I was a little upset and wrote an angry letter to Ramsey Kit.. Mr.
Ramsey called me and proceded to tell me the crystals were fine and
I must have built the kit wrong and wnated to know who the person was
that told me about the crystals (decided not to get an honest guy
in trouble). Mr. Ramsey told me a bunch of other stuff which turned out
to be a load of cr.p.

This was my first kit and I didn't know much about things.
Sure didn't enjoyu being lied to.

I think Mr. Ramsey is a low life.

|>
|> Whew! This one's gonna be a toughie, all right.

We were talking with our elmer the other night. Another one of the folks has the same problem with his honda. We are planning on having an RFI clinic on the two cars one of these Monday nights. (We get together at WA1RHP's house on Mondays to do electronic projects).

Tom (RHP) has a nice design for a sniffer loop which can be used to find noise sources even in fairly noisy surroundings (i.e. the thing is deaf beyond an inch or two). We'll be going through the car with that.

I am wondering about the electronic ignition circuits. This car has no points for the spark generation, so I'm thinking the SCRs and such used for the switching might be radiating.

The noise IS related to engine RPM. I guess I should look at the audio waveform coming out of the radio with a scope and see if anything looks interesting there.

The DC power did have pretty patterns which were in a picture in the ARRL RFI book, but the filtering took that out. There is still a slight transient (very low voltage) of 3 phase noise, but given the battery experiments, that did not seem to be too important. Perhaps it tells us something about the alternator as an RFI source though?

You talked about (in one of the messages) putting capacitors in/around the alternator. Could you explain the hookup further?

|>

Yeah. I brought this one up because Honda's attitude is really poor. Ed Hare at ARRL HQ got a letter from them that was pretty negative, and I got the same line from the same guy at Honda via telephone. Basically if their cars are broadband noise sources, they don't want to know about it. The only way Honda will live up to it is by FCC or other Federal mandate. Needless to say I'll avoid Honda in the future (Toyota is already on my s**t list, not even for RFI reasons :).

Source record: 281639

I have a VHF/UHF rig in my '84 Honda Accord. It works fine.

I had some alternator whine, but I solved it by putting a big filter in the DC power leads to the radio.

Also, be sure to connect the DC power leads as close as possible to the car battery. At first, I connected my rig's power to the cigarette lighter circuit; it worked OK when the car was running (though I had to add the aforementioned power line filter); but with the engine off, the voltage wasn't high enough to achieve reliable operation. Since I moved the power leads under the hood, I can work the rig with the engine off with no trouble.

Concerning the "foul language" debate:

I have written a program that will filter out all possible words that may
be Politically Incorrect or offend anyone's sensibilities or wordaphobae(tm).
Here is the output of a processed message addressing the problems of No-code,
repeater coordination, spectrum allocation, long FCC response, et al:

---------- Beginning of message ----------
The a of
in the for
if like well
the a for
in because
of to

73,
Kurt
---------- End of message ----------

Are there any more words which will offend people's sensitivities?

Well Jeff, after reading your letter and other peoples letters, I believe the Ramsee should pack their bags and get out of the radio field. If their not going to do better with their products, then IMO they should close.

Thank about it people, only about 5% of the public has access to E-Mail
and to the internet. Just think of all the people that has bought Ramsee radios and couldn't voice their opinion. I bet there are a lot of them.

In short, I feel sorry for the consumers.o

2418. Re: Reciprocal Operating Canada/UK?

Newsgroup: rec.radio.amateur.misc
Date: 1993-05-12 15:11:00 UTC
From: IKENDALL@UNIVERSITY-OF-HUMBERSIDE.AC.UK
Message-ID: <9305121512.AA03107@ucsd.edu>
Source record: 281660

Laura VE7LDH asked if there are are reciprocal agreements between the UK and Canada.

I phoned the RSGB today and the answer is that there are for holders of the Advanced licence (and possibly for others). You will need to complete a form which can be obtained from your own national society. If you cannot get one from them then e-mail me direct with your home address and I will get them to send it to me and I will forward it on to you.

(I would have sent this direct to you but I could not decipher your e-mail address from the message header)

2423. question about Radio Shack 2-MTR HT

Newsgroup: rec.radio.amateur.misc
Date: 1993-05-12 15:59:26 UTC
From: ginsburg@wellfleet.COM
Message-ID: <9305121559.AA00688@ginzo.wellfleet>
Source record: 281659

I recently purchased a Radio Shack HTX-202 HT and last night discovered
that the receiver is swamped with noise from both my NCD X Terminal monitor
and my IBM XT monitor to the point that I'm not sure I could use it on
packet with my current computer equipment. Has anyone else with an HTX-202
experienced similar problems, and if so have the problems been solved?

Thanks and 73,
Scott

2425. Yaesu 747/Icom 728 Comparison

Newsgroup: rec.radio.amateur.misc
Date: 1993-05-12 16:33:03 UTC
From: Charles.R.Hohenstein.1@nd.edu
Message-ID: <Charles.R.Hohenstein.1-120593113147@mac32.debartolo.lab.nd.edu>
Source record: 281636

I am considering both a Yaesu 747 and an Icom 728 for a first HF rig. So far the extent of my reasoning has been:

Both rigs have general coverage reception, noise blanker, -20 dB attenuator, and squelch. Output power is the same. Neither has a notch filter. Both require optional modules for FM. Both seem to be capable of computer control. Weight and size apparently are comparable. So none of these factors helps to distinguish the two rigs.

On the plus side for the Yaesu is the provided CW filter. On the plus side for the Icom is passband tuning and a built-in pre-amp. The Icom has 3 IFs as compared to 2 IFs for the Yaesu, but probably this matters less than the actual implementation of the design. It appears that the cooling system for the Yaesu may be superior. Accessories for the Icom seem to be more plentiful, but I'm not sure I would use them. Also, I have heard that Icom service has been a problem for some.

If anyone can add to or correct my impressions, especially as based on actual use, I would be very appreciative. The above is based on literature I have been able to collect, and I have not had the chance yet to examine either unit (no nearby dealers).

TNX de N9SQE.

2426. Looking for bandpass filters for 140-150MHz

Newsgroup: rec.radio.amateur.misc
Date: 1993-05-12 16:34:39 UTC
From: arm@helix.nih.gov
Message-ID: <1993May12.163439.19171@alw.nih.gov>
Source record: 281635
Cross-posted to: rec.ham-radio,rec.radio.amateur.misc,sci.electronics

My goal is to reduce interference (intermodulation, etc.) from signal sources outside the radio frequency band of my receiver. My receiver works in the 140-150 MHz range. What sorts of commercial bandpass filters are available? What kind of selectivity can I expect? What kind of loss? Are the filters already set up for the 50 ohm input of my receiver/coax, or will I have to impedance match? Is impedance matching necessary?

Please avoid answers like: 1) you can use a cavity (I know that), 2) you can use an inductor and a capacitor (yea), 3) you can use a helical resonator (uh, huh). Answers like:" Toko Hi-power makes helical resonators..." might be of some use, but only a little. Rather, I am looking for specific details on parts, applications notes, and actual experience in using such a device.

For all who respond thoughtfully: thanks.

Source record: 281643

Well, I wasn't going to get into this either, but...

I also bought an FTR-146 kit from Ramsey a couple years ago. It also had some parts missing. I called the and the person there told me yes, they had shipped several kits missing those parts and they had already sent them to me. Sure enough, that very day they arrived in the mail. I assembled the kit, had to pad a couple of the crystals to get them on freq and fiddle the various coils, but it did (and still does) work. Puts out about 4 watts. No, I haven't put it on a spectrum analyzer so I don't know how clean it is. I use it for packet 99% of the time. People I've talked to with it say it sounds fine. I also have built several other Ramsey kits and they all worked. There is some (a lot, sometimes) compromise in the designs. For kits in the $20-30 range, you get what you pay for. For a VHF or UHF transceiver, I think I'd look for a used Icom or equivalent for about the same price as the Ramsey kit. However, some people just like to build stuff and don't have the time or inclination to gather all the parts, etch the boards, etc.

Anyway, just my $0.02 worth.

I must hasten to point out that there are actually 11 proposals, each requiring an individual "no" (or yes or abstain) vote. If you think there are too many groups, I encourage you to vote yes for the ones that you want, and at least abstain from voting against the ones you don't care about ("no" votes should be reserved for newsgroups that you think would be detrimental to Usenet).

During the news.groups discussion, Jon Bloom pointed out that even if *.misc remains an unmanageable anarchy, it's still worthwhile to try to spawn off noise-free forums for topic-specific discussion. Personally, I'm looking forward to the possible creation of TCP/IP, homebrew, and space newsgroups.

Remember, you don't have to agree with the whole thing, Usenet doesn't work like our pork-barrel US Congress! :-)

TNC

```
Speaker ---------------------------------- Ear tip
Mic Audio ---------------||-----*------------ Mic tip
Push-to-Talk --------------/\/\/\--|
Ground/Shield ----------------------------------- Mic ring
```

Use shielded wire; the resistor (4k7) and cap (0.1 uF) can go at either end. I usually put it in the connector shell at the TNC. There should be no connection to the ring of the ear jack or the third contact on the mic (this is used to supply power to electret mics and is current-limited, so you can use a standard 2 conductor 2.5 mm plug here)

I've never had a problem taking anything from a Sony SWS1 through
an R71 in. Transmitters might be another issue.

>But now, with some serious "loosening up", perhaps the ban against
>amateur operators has been lifted? Anyone out there know anything
>that would indicate I should pack up the Yaesu?

There isn't really a ban, it's just that you need to operate at a
designated amateur club station. There have been DXpeditions where hams
have taken equipment in and out in coop with a Chinese ham club,
of which there are many. Mostly cw and mostly funky equipment,
although this is changing fast. I know there was a posting on here
or a nearby group from an American ham who was coordinating a
packet gateway to China, try looking through the archives at
ucsd.edu for mention of China.

I know that Beida (Beijing University) and Qing Hua, at least,
have active ham clubs.

Good luck es 73

>
>We have significantly reduced the price of these to $7.00 a copy. (plus $2.50
>for postage and envelope coverage)

This book was very helpful to me and my wife when we were studying. It provided good explanations of the throry and rules we needed to know and it had the question pool with answers. So we were able to study the material and test ourselves with the actual questions we were pre-paring to face.

However, prospective hams should be aware that the question pools are changing soon. I believe it is in July. Unless the books that are for sale have the *new* questions, they will lose some of their utility in a couple of months.

As always, caveat emptor.

2435. Kenwood AT-50 Fuse

Newsgroup: rec.radio.amateur.misc
Date: 1993-05-12 19:46:42 UTC
From: fred-mckenzie@ksc.nasa.gov
Message-ID: <fred-mckenzie-120593142420@k4dii.ksc.nasa.gov>
Source record: 281653

The Kenwood AT-50 seems to have quite a wide matching range. The specifications state it can match an antenna with up to a 3:1 SWR, but it seems to do much better.

I was playing around with a Hustler 10 meter resonator + mast, and found that the AT-50 would appear to match it on several other bands. I forget which band I was on, it might have been 20 meters, where the AT-50 indicated a match. I then applied full power, and the AT-50's lights went out!

It turns out that there is a small fuse inside the AT-50, in series with the 12 volt line. As far as I can tell, a high RF level inside the tuner caused the over-voltage protection circuit to trigger, which blew the fuse. It hadn't blown during the tune-up cycle, since only a low power level was used. I'm sure there was no excessive voltage, since it was using the car battery, and the engine wasn't running. I used the spare fuse that came with the AT-50, and there has been no further problem.

The fuse is rated at 4 amperes, and appears to be a standard 20 mm size. Markings on the original fuse include the letters, "NSF" and "FBU". Radio Shack has two 4 amp, 20 mm fuses: fast blow and slow blow. I couldn't find any information with either the AT-50 or the TS-50, to determine which style was best. Does anyone know for sure, which style would be correct?

Source record: 281644

From James Miller G3RUH:

Inject your modem TXaudio directly to the transmitter varactor in the
SAT unit via J04 pin 2.

1. Remove the main lid; remove the SAT unit lid.
2. Locate J04 which is a 3 wire connector in the front left-hand corner.
3. Unplug J04, and inject your audio on pin 2, ground on pin 1, using a
screened cable.

This is of course assuming you are using a G3RUH or K9NG 9600 baud FSK
modems. The receive side needs to come straight from the discriminator
which I haven't had a chance to locate yet. Perhaps if someone else
has the necessary hook up information for the receive side, they could
post it here.

I went to JT - Mongolia, with 2 complete Satellite Stations [AO-13]
and antennas last September 1992. I traveled through China, to get to JT,
and had NO PROBLEMS with customs, both times I went through China.
I also stopped by BY1PK, the radio club in Beijing, and talked with them.
They said that people are NOW allowed to have HAM Radio equipment in there
homes, but that most hams in china could not afford the equipment.

Well, first, you don't make any mention of a GOOD EARTH GROUND! I cured ALL my RFI problems years ago by going from a 4' ground rod and some #16 wire to three 6' ground rods and #12 aluminum wire, and modifying the ground plane on my vertical (not applicable to you, of course).
Second, you said you fixed the coax and went from 3:1 to 1.25:1. You later mention that you messed with the rig and "STill 3:1". Either you tried fixing the rig before you fixed the coax, or you messed something up in the rig; if changing things in the rig made the reading go from 1.25 to 3, you mismatched the output somehow.

Try some of these...

1. How close is your antenna and/or your coax to the CLOSEST POINT of whatever antenna system your VCR is connected to? That means the rabbit ears, or the roof-mount log-periodic, or the cable TV system AT ANY POINT (distribution boxes, coaxial cable, etc.). Might just be proximity. You don't say whether you come through the TV set's front end, you only mention the VCR.
2. Go to Radio Shack and spend $1.19 on two 75-ohm terminators, part 15-1144. Disconnect the 75-ohm coax from the VCR input and replace it with a terminator. Key up and see if anything at ALL changes on the screen (should go from random snow to weirdness if you're just getting into the VCR innards, no change whatever if that's not the problem). If you get into the TV too, try the same there; if you have a matching transformer between the VCR and the TV (i.e. the TV wants 300-ohm input), skip the terminator and use a 300 or 330 ohm resistor right at the TV input terminals instead. Check as above.
3. Check YOUR coax. Short the end farthest from the transmitter, and key up just long enough to make a brief SWR reading. If it's not sky-high, something's wrong (water damage, etc.) with your coax.
4. Beg, borrow or (gulp) buy a low-pass filter. Make SURE it's WELL grounded (but NOT a separate ground from that you use to ground the rig, or you could make more problems than you solve). See if the problem is still there.
5. Cheaper than a low-pass filter for the rig is a GOOD high-pass filter for the VCR. Avoid Radio Shack; get a good, metal-shielded one made by someone like Winegard or Jerrold, at a local TV parts distributor.

Ground it (separately from the rig) if you can; house ground is not perfect but I've found it's usually good enough.
6. DELICATELY check with a neighbor. DO NOT mention your rig; just mention casually that something's been interfering with your TV lately, and ask if he/she/it has had the same problem.
7. Make sure ALL cabling is as short as possible. Just because you had that six-foot cable that came with the VCR doesn't mean you shouldn't make yourself a two-foot cable if that's all you need.
8. Try one of those snap-on ferrite chokes (Radio Shack 273-105). Try it on the coax input to the VCR. Try it on the VCR power cord. Try it on the power line cord to your rig. If you're using an external power supply, try it on the leads between the power supply and the rig. In fact, try it everywhere (on the TV or rig) it will fit.
9. Akin to the above, get a line-noise interference suppressor. I bought a complete power strip with both surge protection and interference suppression at Wal-Mart for about $7, and they're cheaper now that Target has moved into town; it certainly can't hurt anything, since you get the surge suppression free in the bargain. (Caution: if your rig IS sending harmonics, using it on the rig can make it WORSE, since your system is no longer partially damped by the inductances, etc. of the power distribution system.)
10. Learn the exact reason you don't get a 1.0:1 SWR. If your antenna is supposed to have an impedance of either 62.5 ohms or 40 ohms, that would explain 1.25:1 and all's well (assuming 50 ohm output impedance of the rig). (I think.) If not, tune the antenna until the antenna's theoretical impedance divided by your rig's output impedance equals the SWR.
11. Try an antenna tuner for the rig (especially if you can borrow one).

If all else fails, there must be SOME local elmer or club around; ask around and SOMEBODY just HAS to have a spectrum analyzer somewhere. It's worth the effort to find one, if not for the peace of mind, then just for the fact that you can proudly and exactly announce the attenuation of your worst spur (it was nice to be able to tell people that my IC-02AT had no spurs greater than -65 dB of the fundamental, and especially fun when a buddy who was so proud of his other brand couldn't claim any better than -40 dB :-).

Happy hunting!

The context of call signs kinda precludes anyone's having mentioned this one, but "five" and "nine" are my favorites, because I get a good laugh out of hearing CBers say "fiver", not realizing that the 'r' in "niner" is meant solely to distinguish it from "five" in QRM/QRN and not to sound like a "real radio operator".

>I am trying to decide between an Alinco DJT180T and a Yaesu FT411 HT.
>Can anyone HELP me choose the better of the two ???

I don't know anything about the Yaesu, but I own a DJ180T.

Things I like:

Nice feel. Not TOO hard to learn to program. Buttons aren't as difficult to hit with big fingers as with some rigs, though you sometimes end up using a fingernail. Very good receiver. Takes a beating (I've dropped mine on concrete from 3 to 5 feet several times, gotta stop eating those lard cakes!) and doesn't complain. PTT button has two "hot spots" and neither takes a lot of pressure to keep you on the air (some radios, your fingers get tired just while giving your callsign!). American version has CTCSS ("PL") and touch-tone pad built in. Tone squelch is also built right in. Auto power-off option after 30 minutes (but see below). Belt clip is firm and won't fall off your pocket or pants waist easily. Batteries can be changed with one hand with a little practice; with a little more practice, you can program anything on the rig with one hand (and a little juggling :-) (but don't try it while driving!). All available (internal) accessories are installed by removing a small access plate; no need to disassemble the entire rig. Light goes off five seconds after you turn it on automatically, but (they don't seem to mention this in the manual) stays on longer if you're changing settings; light doesn't seem to draw much power, but is adequate for seeing the display. As shipped, when outside the ham bands, transmit is automatically disabled (but curiously, the tx/rx offset can be programmed from 0 to 15.995 MHz???; suggests there exist some mods for out-of-band use, though I haven't found them yet). Receives well through the entire range of 130-174 MHz, no problems phase-locking onto a signal; "wide-band" transmissions on commercial frequencies come through clearly. Accepts "standard" (Icom-type) speaker-mike; Alinco makes a couple of their own, but when I compared several types and brands of mikes I settled on the Radio Shack speaker mike at $19.95. Relatively good audio, both through the internal teeny little speaker and through an external speaker. Feature allows you to lock either the buttons (frequency, PL, offset, etc.) or the PTT, or both, if you like.

Things I don't like:

Out of the box, my particular rig has VERY "hot" audio; I have to stay well away from the mike and I'm useless in a noisy environment (can be adjusted, haven't gotten to it yet; appears to be my rig only, another

owner I know doesn't have the problem). Comes with "stubby duck"; full-size rubber duck extra-cost option. Aggravating to tune, since the numeric keypad on the front is only WIRED to the DTMF chip; you canNOT just punch in a frequency, you keep turning the knob on top forever until you get there (or use the scan function); however, you can change either 1 MHz per click or "step-size" (programmable at 5, 10, 12.5, 15, 20 or 25 KHz per step). Batteries need "conditioning"; out of the box, a full charge gave me one hour of RECEIVE-ONLY time, but after several charge/discharge cycles both the included battery and the one I bought will go a little better than I'd expect for a 700 mAh battery. No signal-strength indicator; either "BUSY" or nothing. Display is small (but good layout; only thing really hard to see is whether you're on low or high power). No provision for external power supply; $16.95 "battery replacement" unit requires $9.95 cigarette lighter plug (the latter you can make yourself with Radio Shack parts cheaper, the former is inescapable); battery can NOT be attached while unit is attached, no provisions for charging the battery "on the fly". Don't yet know of any aftermarket batteries for this unit (the quality is good, but all manufacturers' prices are higher than aftermarket), but someone will come along eventually (I hope). Instruction manual has a few scattered errors in it (for example, if you buy one, be sure to ask how to store a frequency/offset/PL in a memory!). Auto power-off timer resets if anything breaks squelch, so don't go to sleep listening to the local police frequency. "MONI"(tor) key opens the squelch (nice), but is useless to try to hear someone on the input of a repeater since it uses the receive frequency you're set to instead of the transmit frequency.

Hope this helps. Maybe someone can make a similar posting about the Yaesu, so you can compare notes.

>group individually in the CFV. This works out much better. I did vote no
>on most of the groups but space, homebrew and instruction got a yes vote.
>My $.02

That must have been easy to miss or something. (I don't know how many times we said it.) Yes, there are actually 11 separate votes going on - one for each proposed newsgroup.

I'd like to remind everyone that every newsgroup on the proposal got there by people making convincing arguments that their proposed newsgroup had an interested following. They had to convince a scrutinizing, often-skeptical audience. Usually the only sure way to do that was to point out what the current traffic levels are for that topic.

If you don't see the need for a specific newsgroup, you can abstain from voting on it. Someone else did see the need and was able to convince others of its merits.

Please reserve your "no" votes only for groups that you think have some sort of serious problems. After all, someone else had to argue very hard to gain the support of others to get it on the proposal. And, who knows, that person may be supporting the newsgroups you want.

The final decision on each newsgroup is yours... just don't forget to vote.

2449. Looking for simple synthesizer design

Newsgroup: rec.radio.amateur.misc
Date: 1993-05-13 00:37:56 UTC
From: jkesling@cup.portal.com
Message-ID: <81281@cup.portal.com>
Source record: 281664

I recently acquired three VHF Marine tranceivers for free. It seems everyone around here is upgrading from these older crystal controlled rigs to the newer synthesized ones. One of them my dad found in the dumpster.

My first thought was to get a few crystals and retune them from 156MHZ down to 2 Meters for packet. Around here it seems like sysops change frequencies more often than underwear and the thought of spending $20-30 for a pair of crystals that might only be good for a few weeks is not appealing. So my next thought was how about a simple synthesizer.

So, does anyone out there have or know where I can find a simple synthesizer design suitable for such a project?
My thought is use the synthesizer to generate the crystal frequency needed and feed it through the existing multiplier chain. Diode or jumper frequency selection would be fine.

I understand that Motorola has a line of synthesizer chips but I don't have any information on them.

Source record: 281665

Howdy...

I just recently purchased an HR2600 10 mtr rig. I was wondering are there any good enhancements and mods to the rig....including but not limited to freq. expansion mods.... I plan on buying a CHIPSWITCH for the rig in the near future...I have a friend with a 2510 who has the chipswitch and I like what it did for his radio.

Anyway, I'm looking for mods and hints on how to adjust frequency, ie: align actual freq. with what's on the dial...it's about .2 high in freq. Also, I'd like some information on the internal pots, their settings, etc.

Thanks for the bandwidth and information...it looks like a nice rig. If only I can pull 12 meters out of it as well. (Of course, I'll get CB in return, that's a big 10-4 ;^))

Thanks once again...

I've been fighting a similar problem for 5 years in an '88 Jeep
Cherokee. The noise is doesn't seem to be coming down the
wiring from the engine compartment. I'm tied via pretty
heavy cable directly to the battery terminals. Since the battery is
at the front of the engine compatment on the right hand side,
I was originally routing DC thru the firewall, and running
along it to the right side and then forward to the battery.
Re routed thru the firewall, forward along the left side
(as viewed from driver position) and across in front of the
radiator. Made a difference in the noise, but didn't really
reduce it. Tried bonding engine, frame, tailpipe, etc -
no difference. Tried capacitors, etc on alternator - no
difference. Tried "snap on" type inductors from MFJ
on power leads at various places - no difference. Arrgh!

At this point, the next thing I'm looking at is the fuel
injectors. Although the spark splugs are rfi supressed,
the injectors are basically just insulated wires. The problem
there is you can't add much inductance without screwing up
performance.

I'm also trying an end run around the noise problem -
building a DSP kit to filter it out on the other end of the
receiver :-)

I am also interested in the same sort of specific information: and
have run into the same cluster of unhelpful general comments.....
your message was well-put. Lets hope there is *somebody* who knows
enough about the subject to provide some real information. BTW: I
tried an open-stub coax stub and it helped but also sucked up the
weaker in-band signals and absorbed most of my trasmit power. So, I
can say: don't bother.... It acts like an attenuator and not a narrow
passband filter.
But, of course, we are *both* familiar with what *doesn't* work <g>

2455. Benefits of CW

Newsgroup: rec.radio.amateur.misc
Date: 1993-05-13 04:42:01 UTC
From: kennish@diva.Berkeley.EDU
Message-ID: <1ssjip$rkp@agate.berkeley.edu>
Source record: 281669

At the risk of spilling more gas on this fire, here are my 2 cents
on the whole code/no-code issue (yes, I changed the subject to
bypass some kill files....)

What is the purpose of code? Besides being "fun" and a hobby, CW has
a niche in amateur radio for technical reasons.

It is still true that CW is a more reliable method of communication
than phone or any other type of emission readily available to amateur
radio. I say readily, because there are some spread spectrum and
digital modulation methods with large coding gains that will beat out
CW, but I can probably count on my fingers the number of hams that
have such equipment.

CW is a reliable method of communication when the received
S/N ratio is around 0 dB. Voice just doesn't work.

WHY is this important? Because an important aspect of ham radio
is that of emergency communications. Under adverse conditions,
it is of great utility (IMHO) to have a means of communicating
(albeit inefficiently vs. phone) with minimum received signal
strength. It may be due to lack of a good antenna, poor propogation,
or any other reason, but the key here is that you can communicate with
CW under conditions where voice would be unintelligible. If all
one does is ragchew, then big deal. But, if it's an emergency,
it IS a big deal. THIS IS WHY CW (and CODE) is IMPORTANT to Ham
Radio.

There is an unwritten agreement between the band allocating
agencies and the ham radio community to give them that spectrum
in return for community good.

Code is NOT a good filter to keep "CBers" off the airwaves. There may
be a very mild correlation between good operating procedures and
code skill, but to jusify code exams based on that is a poor idea.

Having said this, I support No-Code, with a caveat. No-code
licenses should expire after some time. Renewal would require
the 5 wpm (Element 1A) test be passed. No-code licenses should
be an entry way into a hobby. If the person is enthused enough
about it, s/he will learn the code. Netland has stats about
some 65% of no-codes upgrading. If the no-code doesn't want to
spend time upgrading, then the ticket expires. THAT should be
the filter -- self generated interest in the hobby. People that
are interested tend to care about the hobby and will be good operators.

As a side note, the ARRL should consider promoting the GMRS frequencies
for those that want general purpose 2-way radio communications. Yes,
a proportion of the no-code techs just want a way of using a HT
as a walkie talkie when they go camping. GMRS is better for them
and it keeps them off the ham bands. Even if they learn code, they
are unlikely to be really good operators, because they don't care.

Ah yes, for those that just have to know, so they can form stereotypical
notions, yes, I am a code-tech for the reasons stated above. Also,
as netland says, the writtens are a joke. Passed all of them in
one fell swoop. More on that later.... Now to get code to 20......

Message-ID: <1993May13.055429.14691@physics.unr.edu>
Source record: 281676

Don't forget that the Novice license, when it first came out was good for only 1 year. Non-renewable.

People cried that one year wasn't long enough to get from 5 wpm to 13 wpm. So the FCC changed things and said that it could be renewed one time. So, bingo, a 2 year novice license.

Even more people cried even louder and it was changed to a regular term license.

Making things easy for the sake of easy never ends. What is needed is to motivate people to want to be hams.

Figure out how to do that and you win the prize.

>packet with my current computer equipment. Has anyone else with an HTX-202
>experienced similar problems, and if so have the problems been solved?

This is a very common problem. Monitors and HTs on rubber ducks don't
get along well. There are steps you can take to quieten the monitors,
conductive sprays, wire mesh, etc, but the easiest approach is to use
a remote antenna on the radio to get it out of the near field of the
offending monitor. This can be a problem with most HTs that have wide
receive capability since the outdoor antenna will receive too much out
of band energy and suffer extreme intermod (the ducky is an attenuator).
Fortunately you have the HTX-202 which has very good out of band filtering,
therefore it will work properly with an outside antenna attached.

> though they may answer a call, act as if they wish you'd go away.

Actually, it's because some of the alien calls make such a nuisance of
themselves. I know we've got two 'alien' calls that I've heard on the
.70 repeater here in Providence and by far, I hear those calls thrown
out over, and over, and over, and over...ad infinitum. So if you ever
hear N2TYC or KA3WLB..... you'll know. :) But on the other hand, there
are also so-called 'alien' calls that really don't bother us.

> All those with CW privileges do have one big advantage, though, if they feel

2460. Thai Ham Informations

Newsgroup: rec.radio.amateur.misc
Date: 1993-05-13 09:08:12 UTC
From: jade@nwg.nectec.or.TH
Message-ID: <9305130908.AA29806@nwg.nectec.or.th>
Source record: 281772

Dear Netters,

I'm very glad to be read the informations of HAMs in the Stateside.
I'm a Thai born citizen, living in Bangkok, capital city of Thailand
I held an Intermediate Class license in Thai. My homecall is HS1ZEB.
Also, the the Technician No Code as N3JTV. You can reach to my
address or any informations needed can be posted to me directly
through my EMail address. (jade@nwg.nectec.or.th)

FYI, Thailand has 3 class of license. They are..

1. Novice Class, which only allow the uses of 2m FM (144-146Mhz).
We're trying to conduct the use of SSB and CW to the class as well.
Note that we doesn't allow repeater, DTMF, CTCSS operations yet..

2. Intermediate Class, which allow us to use 2m FM, CW. Not SSB.
Packet Radio or any other digital mode are not allowed to operate
yet. But we're trying our best for them Digital to go to NOS.. And
HF, 10, 15, 20, 40, 80 bands are allowed. SSB and CW. With maximum
power of 150 watts. No Digital mode as well.

3. Advanced Class, which is not being held yet in Thailand. We can't
expect anything on this class at the moment. No previledges assigned.

I just got the informations this newsgroup a few days ago. And
decided to write any messages on the advancement of the Thai hams
society. We're trying our best to work on Satellies and Packet Radio.
Since the PTD (Post Telegraph Department) already release the
band-plan of the 2m frequency. With EME channels, CW channels,
Repeater channels, Satellite channels, etc. But we're not allowed yet
to use them.. 8*(

I will try to post regular on the Thai's Hams news to the group more
frequent.

I have uploaded to WSMR-SIMTEL20.Army.Mil and OAK.Oakland.Edu:

pd1:<msdos.hamradio>
WRTLOG60.ZIP WriteLog 6.0: Logging Shareware for Windows3.1

WriteLog is an amateur radio log keeping program designed specifically
for radio contesting and also useful for general log keeping. It
requires Windows 3.1, 2M RAM. Features:

Dynamically loadable contest modules. Includes modules
for ARRL SS, ARRL 10M, ARRL 160M, NAS, CQ WW DX, CQ WW WPX,
European DX contest, NAQP, and more.

Control of and automatic frequency logging for computer interfaced
rigs from Kenwood and Ten Tec. (Icom and Yaesu field test
software also included.)

Automated transmission of CW, RTTY, Voice (on multimedia PC)

Spreadsheet-style log display and edit.

Packet interface with scrolling display of recent spots.

Shareware. Evaluate it for your first 100 QSOs, then you owe the
registration fee. Sources are also available for an additional
charge.

2462. Looking for replacement battery for Sony Air-8

Newsgroup: rec.radio.amateur.misc
Date: 1993-05-13 10:03:33 UTC
From: rdd@cactus.org
Message-ID: <1993May13.100333.7165@cactus.org>
Source record: 281682

I've been using a Sony Air-8 receiver with a ni-cad battery pack for the past five years; I bought it second-hand. Last week, I made the mistake of leaving the radio in a glove compartment for two days, in hot weather: it pretty much totalled the battery pack. I then discovered that I didn't have the original battery pack, so couldn't go back to standard batteries.

The only place I know of that sells these things, new, is Sporty's Pilot Shop, which wants an arm and a leg for either another nicad pack ($40) or a car adapter ($40).

Does anyone know of a cheap source for this type of stuff? I'll probably buy another ni-cad pack eventually, but for right now just want a holder for the AA batteries. It's a $0.50 piece of plastic, so Sony probably charges, oh, $20. :-) A car charger would also be nice; the radio requires 6VDC at (apparently) 450 milliamps.

Advice/recommendations would be of interest; also, any pointers to Sony's warranty or service structure for the radio would also be useful, since I didn't receive the warranty information with the radio.

2463. Electronic replacement for R7000 CO Relay?

Newsgroup: rec.radio.amateur.misc
Date: 1993-05-13 12:14:17 UTC
From: lee@tosspot.sv.com
Message-ID: <iimH4B1w165w@tosspot.sv.com>
Source record: 281683
Cross-posted to: rec.radio.shortwave,rec.radio.amateur.misc,alt.radio.scanner

Hi all.

Question -

The Icom R7000 is a fine wideband receiver. I use it under computer control. One problem that I forever keep butting my head against is that when trying to perform high speed scanning, latency in the operation of the mechanical carrier operated relay leads to incorrect channel activity sensing and reporting.

Would any kind soul out there have a simple design for a solid state replacement for this relay? (Of course, pcb template would be even better <grin>)

Sources, suggestions, etc. gratefully accepted.

Thanks,
Lee.

Hello Netters,
Anybody out there using Yaesu FT-767GX in the States? I'm using one now, with the intention to use on Packet Radio, but seeing in the manual that it asked to set in three special way, one for SSB operations, One for FM operation, and another one for FSK. I don't know if there's any way on putting them together? If anybody are using the Ft-767GX, please let me know your tips.

>The real G5RV was designed for 20M and it wll work pretty well there if
>it's constructed carefully. On other bands it's really a compromise.

Excellent G5RV description deleted.

>Get a copy of the Handbook or the Antenna Handbook for more info. A decent
>wire antenna is cheap and easy and they work reasonably well, depending on
>their environment (mainly how high they are).

The ARRL Handbook and ARRL Antenna Book do contain descriptions of
all sorts of wire (and other) antennas. Naturally, the Antenna Book
has more. :-). However, only the newest edition (16th) of the
Antenna Book has a description of the G5RV antenna -- and it is a real
short description. The Antenna Compendium, Vol 1, does have an article
on an updated G5RV written by G5RV.

As a service to our members, the ARRL Technical Information Service
has prepared a free reprint of the Antenna Compendium article. (We get
a lot of questions about the G5RV.) Send an SASE to the ARRL Technical
Department Secretary with a specific request for the G5RV TIS reprint.

2469. Info on RMS Electronics Freq. Meter?

Newsgroup: rec.radio.amateur.misc
Date: 1993-05-13 13:35:34 UTC
From: jra@law7.DaytonOH.NCR.COM
Message-ID: <C6ywFB.5By@law7.DaytonOH.NCR.COM>
Source record: 281693
Cross-posted to: rec.radio.amateur.misc,sci.electronics

I just acquired a frequency error meter made by RMS Electronics of Atlanta, GA, and wonder if anyone a) might have a manual for it, or b) knows if RMS or its successor is still around (they're not in Atlanta anymore). I've already checked with Tucker Electronics and they don't have a manual, or a current phone number.

Here are the details:

RMS Model 9403 Digital Frequency Meter, S/N 1317.

This is a seventies-vintage rack mount unit with an LED display. It's actually a frequency error multiplier; you feed a standard signal at 1MHz into it, and the signal under test at any of a number of discrete frequencies. It normalizes the two, multiplies and mixes back down, and displays the error as parts in 10x (x is from 5 to 9).

Looks like a nice unit, if I can get it to work... and a manual would help!

Thanks for any info anyone can provide.

>in a couple of months.

NYT should be OK as long as you are aware of the question changes - it's not like there's been a big rules change. shouldn't be trying to memorize the question pool anyway - should be learning the information such that you can't be tricked up by a question pool change.

2471. Re: What is circular polarization?

Newsgroup: rec.radio.amateur.misc
Date: 1993-05-13 13:57:11 UTC
From: jmichael@vnet.IBM.COM
Message-ID: <19930513.081145.828@almaden.ibm.com>
Source record: 281691

Suppose a light beam is traveling in the z direction and has an electric field vector that is at an angle theta with the x axis at some instant. The vector has components Ex and Ey. The light is linearly polarized if one of these components is always zero or if the angle theta is constant in time. If the tip of the vector E rotates in a circle with time the wave is said to be circularly polarized. This occurs when the magnitude of Ex and Ey are equal. If Ex and Ey are not equal but are out of phase by 90 degrees, the tip of vector E moves in an ellipse and the wave is elliptically polarized. If Ex and Ey are approximately equal in magnitude, but have a randomly varying phase difference, the wave is unpolarized. Hope this helps.

Jim Michael

In article <1993May12.063027.15378@ke4zv.uucp> gary@ke4zv.UUCP (Gary Coffman) writes:
:
:While good receivers are easier to build today than in the past, I'd

I disagree, to some extent. Although there are a lot of steps taken out
of the process (finding/bending a chassis, drilling and punching holes,
mounting tube sockets, etc.), the receivers of the past simply weren't
as sensitive and didn't have the noise figures (front end) of today's.
Today, the wrong layout or _one_ noisy resistor or _slight_ mishandling
of a IGFET can reduce your project from potentially outrageously good
performance to the mediocre performance of yesterday's receivers (by
comparison, of course).
That said, there are some nice building blocks to work with, like
Toyo's helical filter-in-a-can, prebuilt IF strips, PLLs and ICs in
general, and the like, than can ease a lot of the process (especially
the tedium of making a zillion hand-wired connections).

:suggest you build a simple transmitter first and use it with a commercial
:receiver before embarking on the transceiver project. While there are a

Agreed! But I recommend that there be someone in the wings with at
least an oscilloscope who can check the output for nonlinearity and look
for good shielding practice, etc.

:good number of solid state designs in the Handbook and DeMaw's books,
:I think everyone should experience the warm glow of vacuum tubes at
:least once. A good starter rig would use a 12AT7 as oscillator/buffer,

Not too bad an idea, but if he runs into trouble, who's around to help
him troubleshoot it? Not too many people today could interpolate the theory
of tube operation with a -40V bias on a control grid and understand how the
tube could ever conduct, for example.
However, tubes ARE more forgiving of mistakes and won't blow out at
the first misconnection (generally speaking :-).

:and a 1625 as the PA stage, see the 1962 Handbook. This would be capable
:of running 50 watts on the Novice bands. There's nothing tricky about this
:design, and it could even be built "breadboard" style as in the old days.
:You'd still want to package it in perforated metal, available at the hardware
:store, for shielding and electrical safety, but you could avoid having to
:learn chassis punching and other complex metal work by building the actual
:circuits on a plank.

Or perfboard, if he's careful. (Those Greenlee punches are damned
expensive these days!)

:If you'd rather build solid state on circuit board, there are a number of
:designs available in the 1 to 5 watt range that have appeared in QST and
:elsewhere. FAR Circuits among others offers bare boards. Solid state is less
:forgiving of errors than tubes, with a single slip meaning new devices, but
:the low voltages are safer for the novice builder. Once you get into higher
:power, the high currents used in solid state rigs can be hazardous however.

Not sure what you mean here. I'd gladly jump out of a swimming pool and
grab my 12V, 800A car battery, one terminal in each hand; but I wouldn't
grab the screen grid of a pentode for all the tea in China, much less rub
the plate cap of a power output tube. I assume you mean "use fuses
liberally", or "use a prebuilt power supply with current limiting to avoid
smoke".

:On the receiver front, single conversion superhets and DC receiver designs
:abound in the literature. Taming the high gains involved in these designs
:can be more frustrating than dealing with the relatively low gains of a
:transmitter's stages, however, and probably should be reserved for your
:second or third building project. There are single chip designs such as
:those using the 602 that can make receiver building easy, but the challenge
:is low and skills learned small from such an approach.

Good idea, but maybe the 602 could be reserved for the third or fourth
project as he grows more sophisticated in his methods. Same for the
building blocks (e.g., IF strips), which could take a LOT of work out of
his first dual-conversion receiver.

:I'm assuming you have, or have access to, a commercial receiver or
:transceiver. That's the single most valuable bit of test equipment
:you can own, other than your brain, for RF building projects. Think
:of it as a service monitor that can measure frequency, relative signal
:strength, and, in the case of a transceiver, act as a signal generator.
:Trying to work without one is possible, many thousands of hams in the
:past have built their entire stations from scratch, but it certainly
:makes RF experimentation easier and more certain to have one on the
:bench.

Don't forget the dummy load, to avoid overloading the front end of the
receiver/transceiver, in the case of the transmitter project. After
finishing my brand-new Knight T60A years ago, I thought I was getting out
fine... until someone from four miles away called and let me know that my
40-meter transmissions were overloading his receiver on 20! No way for me
to tell, 'cause my transmitter would overload my receiver at ANY frequency
just due to proximity.

I'm SO glad to see someone ambitious enough to even attempt to brew his
own gear, even if he doesn't intend to use it forever. If he can get past
the beating-his-head-against-the-wall-figuring-out-why-it-doesn't-work
stage, he'll find the sense of accomplishment is incomparable. Reminds me
of a guy I know who, after a REAL troubleshooting accomplishment, actually
ran out of the work cubicle, beat his fists on his chest and YELLED to the
entire factory, "I'm Superman!!!"
And it's nice to see people like you jump in, not only with encouragement,

but also with constructive suggestions.

ZCZC AS07
QST DE W1AW
SPACE BULLETIN 027 ARLS027
FROM ARRL HEADQUARTERS NEWINGTON, CT
MAY 12, 1993
RELAYED BY KB8NW/OBS & BARF-80 BBS
TO ALL RADIO AMATEURS

SB SPACE ARL ARLS027
ARLS027 ARSENE LAUNCHED

SUCCESSFUL LAUNCH OF THE ARSENE SATELLITE

THE FIRST AMATEUR RADIO SATELLITE OF 1993 WAS LAUNCHED FROM THE
KOUR U SPACE CENTER, FRENCH GUIANA, ON MAY 12 (UTC). THE FRENCH
ARSENE PACKET-RADIO SATELLITE WAS CARRIED INTO ORBIT ABOARD AN
ARIANE V56A ROCKET ALONG WITH AN ASTRA COMMERCIAL TELECOMMUNICATIONS
SATELLITE.

APPROXIMATELY 25 MINUTES AFTER LIFT-OFF, THE ARSENE SATELLITE
SEPARATED FROM THE ARIANE BOOSTER. ITS ENGINEERING BEACON WAS
MONITORED AT ARRL HEADQUARTERS WITHIN 2 HOURS AFTER ACHIEVING ORBIT.
ACCORDING TO THE MISSION PLAN, ARSENE WILL BE PLACED INTO AN
ELLIPTICAL ORBIT WITH AN APOGEE OF 36,000 KM.

ARSENE WILL FUNCTION AS A PACKET RELAY, SIMILAR TO A DIGIPEATER.
UPLINKS AND DOWNLINKS WILL UTILIZE STANDARD AX.25 PACKET PROTOCOL.
UNLIKE PRESENT PACSATS, HOWEVER, ARSENE WILL EMPLOY FM ON BOTH THE
UPLINKS AND DOWNLINKS. UPLINKS WILL TAKE PLACE ON 435.05, 435.10 AND
435.15 MHZ. DOWNLINKS WILL BE ON 145.975 AND 2446.540 MHZ.

DO NOT ATTEMPT TO USE ARSENE UNTIL THE SPACECRAFT SYSTEMS HAVE BEEN
FULLY TESTED. THIS WILL REQUIRE FOUR TO FIVE DAYS. WATCH FOR
ADDITIONAL ARRL BULLETINS ON THE STATUS OF ARSENE.

THE ARRL CONGRATULATES THE CENTRE NATIONAL D'ETUDES SPATIALES AND
THE RADIO AMATEUR CLUB DE L'ESPACE ON A SUCCESSFUL LAUNCH.

2476. Improvised Coax Switch - Standard "Light" Switch??

Newsgroup: rec.radio.amateur.misc
Date: 1993-05-13 15:08:57 UTC
From: tbutterf@emx.cc.utexas.edu
Message-ID: <1stoa9INNgi6@emx.cc.utexas.edu>
Source record: 281688

In a thread some time back there was a discussion about Coax switches, their costs and improvised solutions. Has anyone had experience pressing common wall-type "light" switches into improvised service?? What kind of switch is appropriate? What power levels will they accomodate..??

What is appealing is the low cost of the suckers....also, metal enclosures and swtich plates are also common and cheap. The little metal enclosure boxes I've seen even have neat little holes (you punch the metal out to get the hole] that are about the same size as a coax connector. It would be great if these switches could be used.

I use my HTX-202 for packet. I had the same problem that you do when I
tried to operate from the "rubber duck" antenna. I tried some
other antennas (5/8 wave ground plane and 2-elt quad). Just
moving the antenna away from the computer about 10 feet virtually
eliminated the RFI from the machine.

Bad idea! Abstaining on a vote is the same as a "yes" vote. Since SOMEONE wanted the group, or it wouldn't be on the ballet. Abstaining is how we get these groups that pass with 6 "yes" votes, and 0 "no" votes (and 40,000 abstentions)

Vote NO for any group that you don't want to vote YES for! We have too many unused newsgroups already.

2479. Motorola "Keynote" Pagers - need advice

Newsgroup: rec.radio.amateur.misc
Date: 1993-05-13 16:17:30 UTC
From: awpaeth@watcgl.uwaterloo.ca
Message-ID: <C6z3x6.3nJ@watcgl.uwaterloo.ca>
Source record: 281696

I have a number of Motorola "Keynote" voice pagers (these look like
little black microphones, sans coil cord) that I want to rekey for use
in the 2m band. They are presently at around 151MHz, but that is no problem.
The problem (and virtue) is that the squelch opens on these when they are
sent a key which matches the contents of an internal EEPROM -- there are no
"permacode" modules to resocket as with older Motorola pagers.

If anyone has field experience reprogramming such pagers or any other advise
I'd like to hear from you. Near as I can tell, there are a few plated traces
on the tongue of a PC board hidden behind the safety lock for the 1.5v battery
compartment. A connector narrow enough to fit through this slot could then
reprogram the EEPROM in bit serial fashion. I'm hoping (1) for an "open on
carrier detect" code and (2) for a simple means to toggle in this code low
rates. Failing that, even just rekeying it to a known key would be worthwhile.

Many thanks.

/Alan Paeth

World Administrative Radio Conference. It's the name given to those
big orgies the League sends "observers" to. :-)

Seriously they are the diplomatic meetings where new radio treaties
are hammered out. The ITU (International Telecommunications Union)
schedules WARCs when issues arise that need global attention. There
are two kinds of WARCs, special and general. General WARCs are rare
free for alls where everything is up for grabs. Usually there's some
topic, like space allocations, or shortwave broadcast allocations, that
need settling. The ITU will call a special WARC and they'll hammer out
an agreement. That's why you'll hear references to "competent" WARCs
when amateur radio matters are discussed. Only a general WARC or a
special WARC called with a charter to address amateur issues is "competent".

Cecil,

I didn't mind the problems... my complaint is the nasty
way Mr. Ramsey lied to me, and the fact that they should
have just replaced the crystals... I have built a lot of
kits and never had this problem.. most of the other
manufacturers of ham radio equipment seem a lot
more reputable..

PS.. my 2 meter rig has been working fine.. I use it daily
mostly for packet

Not quite true. In order for any group to be created, the vote must satisfy two conditions:

1. 2/3 of the votes cast must be in favor
2. The difference between the number of yes votes and no votes must be at least 100.

If the yes votes don't outnumber the no's by at least 100, nothing happens.

If you don't care, ABSTAIN.

I just can't help but be amazed at the attitudes of some people ...

1) If the FCC tried to enforce any US laws in the UK they would
be promptly told where to stick their laws, and then be deported.

2) Those tiny wireless mikes are actually illegal in the UK.

3) You forgot about the copyright issue :-)

Maybe no-one told you, but this system ISN'T USA only.

Philip

Call ICOM at 206-454-7619 and ask for parts. If you got the radio used and without documentation, they may just send it to you for free... Always worth asking!

(I tried to reply via email... bounced. try to get your "From" line fixed so that it puts out a valid address).

2490. Re: What is circular polarization?

Newsgroup: rec.radio.amateur.misc
Date: 1993-05-13 18:26:33 UTC
From: myers@hpfcso.FC.HP.COM
Message-ID: <103360181@hpfcso.FC.HP.COM>
Source record: 281552

The polarization of the an EM wave is defined to be the polarization
of the electric-field component of that wave; in other words, the plane
of polarization is that plane in which the E-field "lies."

In most simple antennas, the plane of the E-field does not change; for example,
in a dipole antenna, the E-field is created "between the ends" of the
antenna (as they are at equal but opposite potentials, wrt to the feed point),
and so the polarization is in the same plane as the antenna itself - a
horizontal dipole produces a horizontally-polarized signal.

Some antennas, however, produce a signal which has the property of changing
polarization with time, as seen by an observer at any fixed point. The
simplest one to understand is the helical antenna, which produces a
circularly-polarized signal; the plane of the E-field changes with time,
rotating from horizontal to vertical and around again and again. Circular
polarization comes in two basic "flavors", depending on whether the
rotation is clockwise or counter clockwise - these are typically
referred to as "right hand" and "left hand" circ. polarizations, which works
the same ways as the threads on a screw.

To understand how the polarization changes, consider what happens as the
original signal travels down the helical radiating element; follow a
given "peak" in the wave, and note that it moves around in a circle as
it travels along the element. Clearly, the E-field produced between this
peak and some other point must also be rotating in a similar manner. This
rotation, remember, is simply how the field appears to a fixed observer;
the polarization of a given point in the wavefront does NOT change as it
moves past any point (or ever, for that matter), but the corresponding
"point" a tiny period of time later will show slightly different polarization
- hence the appearance of rotation.

I almost went to a scanner club meeting last night. I had always been a lone-wolf scanner buff: getting my information from periodicals and the net. I never looked at scanning as a group activity. But, I am the curious sort. I would have gone except that I just finished two 12 hour days at work and figured that I could use the sleep.

Boy, was I wrong! Nine PM and my doorbell rings like crazy. At the same time my wife and I say to each other: "Were you expecting anyone?". And at the same time: "No".

I open it up to find a figure in dark blue. "LAPD. We are going to be in your bushes, so don't call the police or turn on your outside lights". "You must be lost, this isn't Los Angeles." "We know that. We aren't lost." "What's happening?" "We'll tell you later."

I felt it strange the a cop would tell me not to call the police. And to be out of territory. One way to tell if they are legit is to turn on my trusty scanner. TAC-8. LAPD's Emergency Frequency. It was clear that they were casing the house across the street. "I see him in the window... he has a rifle or shotgun.... he is pacing like he is very agitated".

The cops keep coming in to use my phone. I am told that they have phones... but they are not working. I make them coffee and croissants... hey, I didn't have any donuts. Finally, they ask to borrow my cordless.

Turns out that the guy baricaded across the street just robbed a convenience store with a gun. As time goes on, the residents of the house return. They discover his name, his record and that he is on cocaine and alone in the house. They try to reach him but the phone was busy. I check the cordless freqs for the cops and tell them that if he is on the phone, it isn't a cordless. They thank me. They seem amused that I am following them with a scanner.

They try telling him to come out with a PA system. Over and over to no avail. The homeowners and their children (this guy is the boyfriend of the daughter) are shepherded over to our house. We become the police command post. The neighbors are glad that the scanner lets them follow the proceedings.

Finally, the cops decide to call in the SWAT team. Unfortunately, that means that they have to evacuate all of the neighbors. That means us. We move over one house. The party gets bigger. We listen to the SWAT activities. They position themselves around the entrances. Then they

position the snipers.

Next step, the bull horn. They ask him to hang up the phone so that they could talk to him. No response. Again and again with a busy signal. Then his mother gets on the bullhorn and asks him to come out and he won't be hurt. No response.

Time for the tear gas. As they position six men around various windows, they tell the LAPD regulars to notify the homeowner that they were going to teargas him. Off course, she heard this conversation and knew it before they arrived. We even opened the door just before they knocked!

Turns out that the regular cops couldn't get the SWAT freqs on their handy-taklie. So, my scanner intriqued them. They stayed and listened so they knew what was happening.

The orders went out: 2 rounds from every position. 12 rounds in all. the next order: let him cook in there. then the bull horn. no response. 1 more round from each position. then he came out.

We went back home, they called in the fire department to ventilate the house attacked with their fans. The full episode took 6 hours.

> radio to work

> Jeff,AC4HF

Jeff, in defence of Ramsey, one must understand that the FTR-146 was their first VHF transceiver kit and was not the best design in the world, having one separate oscillator XTAL each for receive, simplex, neg offset, and pos offset. They quickly replaced the FTR-146 with the FX-146 which is a lot better design using a single 10.24 MHz Xtal for frequency control with a Motorola MC145152 synthesizer chip. I and my friend, Bob, W7FEZ, both built FX-146s with very few problems. I had the same problem as you did with my FTR-146 and solved the XTAL problem by installing EPROMs in the diode matrix to give me full frequency coverage including automatic offsets without having to use the offset oscillators which were the main XTAL problem.

>all I know about it. I have seen other interesting discussions about
>antennas here. I'd like to see one on the G5RV. What bands does it
>cover for what lengths of wire? (obviously one could scale it) How
>does it work theoretically? How well does it work practically? Are
>there good ones and bad ones? What does it take to make a good one?
>How does it compare to a trapped dipole?

The Nov. '92 CQ carried an article by Bill Orr, W6SAI, on an
improved G5RV which gave lower SWRs on most bands. Make the
center section 92 ft 6 in instead of 102 ft and the 300 ohm feedline
37 ft 3 in instead of 29 ft 6 in. Antennas West in Provo, UT
has an application note on the G5RV.

|>Please reserve your "no" votes only for groups that you think have some sort
|>of serious problems. After all, someone else had to argue very hard to gain
|>the support of others to get it on the proposal. And, who knows, that person
|>may be supporting the newsgroups you want.
|
|Bad idea! Abstaining on a vote is the same as a "yes" vote. Since SOMEONE
|wanted the group, or it wouldn't be on the ballet. Abstaining is how we
|get these groups that pass with 6 "yes" votes, and 0 "no" votes (and 40,000
|abstentions)
|

The requirements are "twice as many yes votes as no votes AND 100 more yes votes than no votes." There has been talk about making these requirements more stringent, but apparently nothing has come of this?

Hence 6 to 0 will not pass. Never has.

|Vote NO for any group that you don't want to vote YES for! We have too many
|unused newsgroups already.

Well, that is the standard objection. I wouldn't go so far as to say that an abstention == yes. It actually takes quite a bit of momentum to get a group going, and not nearly so much to kill one that would be created.

Groups that fail must wait at least 6 months before making another attempt.

In my experience, the best way to organize the drive to create a new group is to create a mailing list first. Then when you have collected the votes, begin the RFD process.

2496. How do I adjust J-Pole SWR?

Newsgroup: rec.radio.amateur.misc
Date: 1993-05-13 19:13:32 UTC
From: mebly@eng.umd.edu
Message-ID: <1su6ksINNnka@mojo.eng.umd.edu>
Source record: 281712

I just finished teaching a Novice/Technician course. We discussed how to build a J-Pole antenna for 2 meters. A very simple question came up:

"How do I adjust the antenna for minimum SWR?"

So is there a cheap and easy way to adjust the J-Poles? Or do I have to borrow some equipment?

Thanks. E-mail responses welcome.

2497. Newer version of TH-78A has jumpers + diodes

Newsgroup: rec.radio.amateur.misc
Date: 1993-05-13 19:16:31 UTC
From: egurney@vcd.hp.com
Message-ID: <C6zC7K.Ltu@vcd.hp.com>
Source record: 281711

I have a TH-78A (purchased in Dayton LAST year) which I have succesfully performed the cross-band repeat and "Beyond MARS" mod on (the latter extends receive and transmit coverage significantly, including the 800 MHz band.)

My dad decided to buy one in Dayton this year. When he went to do the same mods I did, he found that there are now jumpers as well as diodes!

Since I haven't seen the radio myself (he's in Michigan, I'm in Washington), I can't explain it very well. But I'm hoping someone on the net has experienced the newer radio and can explain how to do the mods.

BTW, you don't have you have to remove the brass shield to perform the mod (at least on the old-style 78's which had only the diodes.) Since one side of the diode sticks outside of the brass shield, you can use a very fine-tipped soldering iron to heat the diode, and then gently pry it up to a 45 degree angle, effectively removing it from the circuit. This has the advantage that it can be easily resoldered (if necessary) later on.

If anyone has any info on the newer 78A's, I'd appreciate hearing about it so I can tell my dad the RIGHT way to modify his radio. I will summarize any useful responses to the net.

Thanks and regards,
Ed

P.S. Does anyone know how to restore all of the step sizes present in the 440 band to the 800 MHz band? As it stands, when you switch to 800 MHz you only get 12.5 and 25 kHz step sizes. 5 and 10 kHz would be nice to have as well. I assume that this is hard-coded into the ROM of the microprocessor, but you can always hope...

>
> "How do I adjust the antenna for minimum SWR?"
>
[1] You need an SWR meter capable of working on the desired frequency. You could also use a wattmeter or alike....

[2] J-Poles are typically shorted at the base and you feed them up from this short [anywhere from 1 1/4-1 1/2"]. To tune the j-pole for min. SWR you need to adjust this feedpoint. I am a little sloppy and like to hold the center conductor of the coax to the antenna and move it until I get a good SWR. When I find the sweet-spot I attach it permanently. Any variation after soldering the coax to the antenna tends to be minimal.

2500. BUY BACK 11 METERS! (was Re: Selling the Airwaves -- News from Washington

Newsgroup: rec.radio.amateur.misc
Date: 1993-05-13 20:45:20 UTC

Source record: 281715
Cross-posted to: rec.radio.amateur.misc,alt.radio.scanner

This is actually GOOD NEWS in disguise...let's all write the ARRL and lobby for the OUTRIGHT PURCHASE of the 27.4051-28.0 MHz band segment!!

In effect let's BUY BACK 11 METERS AS AN AMATEUR ALLOCATION! It's NOT CURRENTLY ASSIGNED. IT'S ADJACENT TO OUR 10 METER ALLOCATION and it's probably not a very attractive area for commercial applications..hence the price should be low enough to allow the Amateur community to afford it without worrying about the CBers outbidding us.

I think it's World Administrative Radio Conference (Convention? Committee?). Anyway, it's the international body that meets periodically to try to agree on world-wide use of the radio spectrum. I think it's under the auspices of the ITU (International Telecommunications Union) which is part of the United Nations. The so-called WARC bands are the 30M, 17M, and 12M bands. They were allocated to amateur radio use in one of the WARC meetings (1979?). The most recent meeting was held last year in Spain.

Source record: 281608

I have been reading quite a lot here about how various HT's and scanners and such are modify-able. As the HTs are concerned, a user may modify the radio to transmit outside of designated amateur bands. My question is WHY do manufacturers knowingly engineer and manufacture radios that can do this? Is it to satisfy the ham's incurable urge to tinker? (i.e. they know hams are going to mess with something, so they provide 'hidden' features so that messers don't REALLY mess up their radio!) Or is there some practical reason that prevents them from engineering a systhesized-tuning radio that can only synthesize ham freqs from the chip level? WHY? WHY? WHY?

Just wondering...

Gotta add my 2 cents worth.

I purchased Ramsey's 40m QRP xmtr kit and corresponding rcvr kit at a
hamfest this spring.
All the pieces were there and both kits worked without a hitch.
My only major beef is that the xtal included with xmtr kit is not
in the novice band.

> about ("no" votes should be reserved for newsgroups that you think would
> be detrimental to Usenet).

ARGHHHH!!!!! Please vote the way you feel you should vote. Yes means
yes, no means no and abstain means don't care. My guess is that for
most of the readers of these groups those terms are self-explanatory.

Doggone it Paul, if you feel as I do that there are *WAY TOO MANY
GROUPS* the best way to keep the divisions from happening is to vote no
on the groups you don't want. That's exactly what I intend to do, and
it's what I would encourage others to do as well.

I'll assume your directions are well-intended, but from where I stand if
people follow your rules it almost guarantees passage of the new groups.
That's something many here simply don't want. Was that your intent?

Let's keep this thing fair and allow people to vote for, against or
abstain as they choose. The amount of work that went into these
proposals should be appreciated, but is irrelevant to the voting
process. Let the groups stand or fall on their own merits.

BTW, I personally do believe that this recent trend to excessively
subdivide groups is detrimental to Usenet *users*.

I'll be voting no.

PS I picked on Paul's posting, but a similar one from Ian Kluft carried
an almost identical message.

Warning: This is my first post; hope it works and doesn't offend anyone. :-)

I've had my no-code for a year now and haven't been on the air yet. I was intrigued by the Radio Shack HTX-202 HT and the rumors that it will be on sale next week for $200. Does anyone know some of the major strengths and weaknesses of the Radio Shack 2M HT?

Also, does a 2M HT work very well from inside the vehicle? I noticed that RS has a BNC extension with suction cups to attach to the windshield, would that help? RS had a magnetic mount 2M 5/8 wave antenna, has any one had experience with it? Tendency to scratch, performance, etc.

>abstentions)

>Vote NO for any group that you don't want to vote YES for! We have too many
>unused newsgroups already.

An abstention isn't equivalent to yes because this isn't a simple majority
vote. Each newsgroup, in order to pass, needs at least a 2/3 majority and
the yes votes need to outnumber the no votes by at least 100.

Amazingly, even on UseNet, getting enough participation in the vote isn't
always a given. As an example of what voting volumes have been seen in other
groups, here are some recent results I pulled out of my news spool:
comp.sys.harris passes 134:9
soc.college.teaching-asst passes 233:37
talk.politics.conservative fails 155:58
comp.object.logic passes 195:22
rec.music.light-rock fails 79:49
comp.dcom.lans.token-ring passes 143:10

Only one of those even got into the 200's so the 100-vote-margin requirement
can be considered significant. (That's probably good, too. Making a new
newsgroup should not be easy.)

So, having shown what the voter turnout typically is, more people will probably
agree now that it's OK to abstain if you don't have an opinion on a given
newsgroup.

That's also why I keep reminding people - don't forget to vote. I hope I'm
not the only one doing that. (If enough people participate in the vote then
we will be able to say the process worked, whatever the results.)

Several amateurs have been asked to accompany a very large group of teens just south of the border. The teens will be building houses (however much work can be done in one day) and the amateurs have been asked to provide emergency communications, should an emergency occur.

What paperwork needs to be done (and can it be done in just a few weeks) for the hams to legally operate in Mexico?

Has anyone had any experience using 2 meters in Mexico? Do the local (Mexican) authorities care?

I would appreciate any advice. Thanks.

: design suitable for such a project?
: My thought is use the synthesizer to generate the crystal frequency needed
: and feed it through the existing multiplier chain. Diode or jumper frequency
: selection would be fine.

Years ago, when synthesized radios first started coming out, there was
a kit made by GLB Electronics that did exactly what you want. There were
several options to accomodate the various crystal frequencies (6 MHz,
8 MHz, etc) required. The technology used would seem just a tad out of
date today (standard TTL 7400 IC's), but if you could find a used one,
it would be a lot less work than building a synthesizer from scratch.
It uses a separate set of thumbwheels for transmit and receive, or you
can transceive simplex from either set (what you want for packet). I use
one on my old Johnson Fleetcom and it works fine. Put a notice on
rec.radio.swap asking for a "GLB Synthesizer".

2515. Re: How's a Honda Accord w/50W VHF?

Newsgroup: rec.radio.amateur.misc
Date: 1993-05-14 01:19:26 UTC
From: richw@mks.com
Message-ID: <1993May14.011926.7193@mks.com>
Source record: 281578

Another comment on the "alternator whine" or "alternator RFI" issue in Hondas.

As I mentioned before, I initially had alternator whine with my 2M rig in my '84 Honda Accord. I looked at the DC power input to the rig with an oscilloscope, and with the engine running the scope showed little scallops whose frequency varied with engine speed. Putting a filter on the DC input eliminated this stuff entirely. So, in my case at least, I'm pretty confident that the problem was alternator noise entering the radio via the DC power.

Note that my car has electronic ignition but is not computerized.

2516. AMTOR question

Newsgroup: rec.radio.amateur.misc
Date: 1993-05-14 02:18:19 UTC
From: rob@xyzoom.info.com
Message-ID: <1993May14.021819.24161@xyzoom.info.com>
Source record: 281581

I occasionally use AMTOR on HF, finding it a nice mode for the changing conditions of that spectrum. Just today, tuning around 14070--14085 for the first time in a few months, I heard a new sound from some of the AMTOR signals--bursts of longer duration--about one second per turnaround, whereas the AMTOR I've always used (and my PK232 is programmed for) is much shorter, with 2 or 3 bursts per second. The new sound is coming from several different stations, and doesn't appear to be phase handshaking, as I first thought it was (and my PK232 can't make any sense of it).

Can anyone enlighten me about this difference?

Thanks--

Correction to Daily Report for 12 May

/\/\/\/\/\/\/\/\/\/\/\/\/\/\/\/\/\/\/\/\/\/\/\/\

An error was reported in the daily SGDB report for 12 May. The GOES-7
magnetic data (which has been in error since about 02 May) was incorrectly
reported and may cause problems with the BCAST software during extraction.
A corrected copy appears below:

2518. HTX-202 going on sale

Newsgroup: rec.radio.amateur.misc
Date: 1993-05-14 02:27:41 UTC
From: ginsburg@wellfleet.COM
Message-ID: <9305140227.AA02555@ginzo.wellfleet>
Source record: 281331

> I recently purchased a Radio Shack HTX-202 HT... <RFI stuff deleted>

> I believe they will be on sale for ~$200.00 soon. It will be a short
> duration sale (a few days). If you bought the radio within the last
> couple of weeks then I believe you ought to see your RS store manager
> and ask for a price adjustment.
>
> It's a fine radio at its regular price and a great bargain at $200.00.

Actually, it's going on sale the 16th and I was told by the salesperson
that I should come back and get my $60 back. I couldn't pass up a deal like
that!

Thanks to all who commented on computer RFI.

>wall-type "light" switches into improvised service?? What kind of switch is
>appropriate? What power levels will they accomodate..??

A few years ago I remember there was an article in QST on building coax switches from common light switches. From what I remember, the authors found that they worked fine; I'm not sure how much power they put through them, but it was at least 100 watts.

Source record: 281332

How about, instead of having the lower 25KHz of a band set aside for Extras only, let's set aside the lower 50kHz for CW only! Any licensed Ham who can work CW would be free to QSO there. Those who don't like the so-called "no-codes" wouldn't need to worry about them. And licensees who would like to use the sub-bands could do so by learning Morse code.

This is a fine starter radio for the price. It is very similar to the Icom 02AT. Physically, it's not the mini-radio class, and probably was built by Icom, because the battery packs are interchangeable.

Put the hole in your car and mount a 5/8 wave antenna. I prefer Larsen antennas myself. Don't waste efforts on a winshield antenna or the duckie in the car. The couple of watts from that radio will not do it for you. Get a good antenna, perhaps a power amplifier, (10 to 25 Watts output will be fine) and you are on the way to make many fine new friends.

>I find the sweet-spot I attach it permanently. Any variation after soldering
>the coax to the antenna tends to be minimal.
>
A method if have found very effective is to use a loop of wire on the end
of the coax and tape it tightly to the shorted end of the jpole.

The total length of the wire used to make the loop is 13 inches. I read in
hints and kinks in QST and do not rember the hams name that described it. I
have used it with twinlead jpoles and pipe jpoles for the twinlead j's
solder on end of a peice ofd twinlead to the end of the coax. mesure off 7
inches from the coax and cut the twinlead. strip the twinlead back 1/2 inch
twist the two ends togeather and solder. I wrap the coax conection with tape to
insulate it from the shorted end of the j-pole and then tape the loop to the bottom of the jpole.

Good luck

> performance, etc.

I have been using the RS 2M 5/8 wave antenna for about a year now and signal reports are reasonably good. I mounted the thing on the trunk lid and then put a connector on the inside of the hatch. I then ran coax up to the drivers compartment and connect a speaker mike to the radio. The reason I put the hatch connector on was to allow the anntenna to be easily removed (for washing or non-vehicle event support) while having a somewhat permanate (sp) installation.

ZCZC AG96
QST de W1AW
ARRL Bulletin 55 ARLB055
>From ARRL Headquarters Newington CT
May 13, 1993
Relayed by KB8NW/OBS & BARF-80 BBS
To all radio amateurs

SB QST ARL ARLB055
ARLB055 Special call signs

The FCC has amended its Amateur Service rules to provide for
volunteer organizations to administer a system designed to provide
special call signs to club and military recreation stations. This
action was authorized by the Telecommunications Authorization Act of
1992. Organizations selected for the new system will be known as
''Club and Military Recreation Station Call Sign Administrators.''

An administrator must enter into a written agreement with the FCC
and public notices will be issued listing the administrators. To be
an administrator, the oranization must exist for the purpose of
furthering the amateur service. Its membership must include at
least one percent of the amateur operators licensed by the FCC, and
it must be capable of serving as an administrator in all places
where the amateur service is regulated by the FCC.

An administrator must agree to accept and process all
properly-completed license application forms from the trustees of
club stations and from the custodians of military recreation
stations without regard to race, sex, religion, national origin or
membership (or lack thereof) in any amateur service organization.
The organization cannot charge a fee or accept any form of
reimbursement for services provided as an administrator.

Within 10 days of receiving an application, an administrator must
provide the FCC's licensing facility at Gettysburg, PA., with the
actual license document, including the call sign. The document must
be ready for endorsement and mailing.
```

Each administrator will be assigned initially a block of call signs having a two-letter prefix from the NA-NZ ''by three'' series. An example of a block would be NA1AAA through NA0ZZZ. There are 26 possible blocks. The administrator must issue public announcements detailing the policies and procedures of its call sign system.

Dates for accepting applications from potential administrators have not yet been announced.

SB DX ARL ARLD024
ARLD024 DX news

Thanks to Tedd, KB8NW the Ohio/Penn PacketCluster Network Pete,
KB1HY and Steve, WB8IMY, for the items in this week's bulletin.

SPRATLY AND BOUVET ISLANDS. Russian explorer Fedor Koniukhov
continues on his way to Bouvet Island, possibly by way Spratly.
R0L/MM passes traffic everyday on 14275 kHz at 0800z. Daily
communication support is provided by UA0NL and other amateurs in the
far east.

A second yacht has joined the expedition with Tony, BV2AH, among the
members of the team. The radio station on this yacht is signing
BV0MM.

Plans are for both yachts to travel to Singapore, possibly landing
at Spratly Islands to operate as 1S/R0L. From there it is on to
Bouvet. For more info, contact Yuri V. Zaruba, UA9OBA, PO BOX 1,
Novosibirsk-92, 630092, Russia, CIS.

9D, IRAN. A station signing 9D2CW was active on 21335 kHz around
1435Z and 21028 kHz at 1230z.

CAMBODIA. XU1AD, XU5DX and XU7VK were all active this week. XU5DX
was 18085 kHz around 1445z. XU7VK was on 14197 kHz around 1245z.
QSLs for XU7VK via HA0HW. And XU1AD was on 14169 kHz at 1500z.

GHANA. Sewell, 9G1SB, showed up on the 21335 DX net on May 5 and
reported having problems with his TR4C and needed some help. QSL
via CBA.

EQUATORIAL GUINEA. 3C1TR has been on 20 meters SSB with his new QSL
Manager Joe, K8JP. Check around 14196 or 14226 kHz between 2130 and
```

2230z.

LIECHTENSTEIN. Andy, HB9EAS, will be signing HB0/HB9EAS May 14, 15 and 16 from Triesenberg. QSL via the bureau or direct. Direct QSLing will require both SAE and sufficient return postage.

CORSICA. Look for TK/DF4RD, operated by Dieter, from May 24 through June 2. Most activity will be CW. QSL via CBA.

MACEDONIA. Venco, 4N5JA, has been on 20 meter CW SSB. Check 14247 kHz around 2300z, where Alan, WA4JTK, operates a DX net and is the only QSL Manager for 4N5JA when Venco is on frequency. All others QSLs go to 4N5JA direct via the YU5XTC CBA.

CH8MNP, CAMERON ISLAND, CANADA, IOTA NA-009. This summer the Calgary Amateur Radio Association will be sponsoring a DXpedition to Cameron Island. The island is 30 miles south of the north magnetic pole. OPs VE6EHX, VE6TZY, VE6KC, VE6CGY and VE6NAO will run two HF stations and 6 meters from August 18 through 24. This will be the first time grid square DQ76WI has been activated. QSL via VE6AO.

HA5BUS ON THE ROAD AGAIN. IMI/HA6HO, GABOR/HG5BKG and STEVEN/HG5CHI are now active as VE3/HA5BUS on 14025 kHz CW and 14088 kHz RTTY. Plans are for a return to the USA for a visit to Philadelphia and then onto Jacksonville, FL, where the bus will be put on a ship bound for the U.K.

DX-CARIBE CRUISE INFO. This Carribean junket has the following stops scheduled.

Sunday 5/16 Aruba P4,
Monday 5/17 Bonaire PJ,
Tuesday 5/18 Grenada J3,
Wednesday 5/19 Barbados 8P9,
Thursday 5/20 Martinique FM,
Friday 5/21 in transit MM,
Saturday 5/22 Curacao PJ,
Sunday 5/23 Aruba P4.

Suggested frequencies for CW are 3505, 7005, 14025, 18070, 21025, 24895 and 28025 kHz. For SSB, check 3795, 7070/7195, 14195, 18135, 21295, 24935 and 28495 kHz.

Some AO13 operations are planned as well. SSB downlinks will be 145.890 MHz Mode B and 435.960 MHz Mode J. CW downlinks will be 145.870 MHz Mode B and 435.940 MHz Mode J.

MORE SATELLITE DX/NEWS. The ''Satellite Saints'', specifically J8OI on ST. Vincent and V47I on ST. Kitts, were both very active on AO13 this past week. QSL both via W0DQY.

ARSENE. As reported in Space CW28/ARLS028, the recently launched French Arsene packet-radio satellite has apparently suffered a serious failure. According to Jean Gruau, President of the Radio

Amateur Club de L'Espace, their group and space officials were attempting to determine the cause of the problem. Monitor W1AW and PBBSs for further update bulletins.

SB QST ARL ARLB054
ARLB054 Fake SOS brings sentence

An amateur extra class licensee has been sentenced for making fake
distress transmissions on 14.313 MHz.

Fifty-year-old Jorge Mestre, NS3K, of Fairfax, Virginia, had pled
guilty in February to knowingly and willfully communicating false
distress signals on August 7, 1992. At that time he made a plea
agreement to surrender his FCC amateur license, dispose of his
amateur radio equipment within 60 days, and make immediate
restitution of 50,000 dollar(s) to the U.S. Coast Guard.

At sentencing in U.S. District Court in Alexandria, Va., Mestre was
given one year probation on condition of his serving 60 days home
confinement, ordered to perform 200 hours of community service, and
to pay a 50 dollar special assessment.

Mestre could have received a fine of up to 250,000 dollar(s) and up to 6
years imprisonment.

More information is in April, 1993 QST, page 79.

Hi,

First stations with the new prefix for Bosnia-Herzegowina on the air!
Yesterday I heard for the first time stations with T9 prefix.
They worked on all bands ssb and cw.

Gerry,

I also use a G5RV with very good results on the low bands. Mine is double sized, because I wanted it to work well on 160 and didn't care much about what it did on the higher ones. The wires are 104' per side and fed with double length 450 ohm ladder line. I defy all the advice in the books/articles to get it into the house though. I use a Radio Works Balun just outside the shack window and feed it with 16 feet of 9913 coax (just what was handy). The texts all say to use a minimum of xx feet of coax and most say not to use a balun. I used just what it took to get it to the antenna switch. The 440 tunes it great and the signal on 160 and 75 meters gets plenty of attention (160 requires an external tuner since the one in the 440 won't cover that band). Performance on 40 meters is fine but it is poor on 20. By the way, the wire is in inverted vee configuration and is 40 feet in the center and 3-6 feet from the ground on the ends.

I would highly recommend a G5RV to anyone.

From: wvanhorn@magnus.acs.ohio-state.edu
Message-ID: <1svucr$spl@charm.magnus.acs.ohio-state.edu>
Source record: 281586

Dear Rob:

The "AMTOR" with long-duration (approx 1 second) bursts that you heard
is PACTOR.

Pactor is a mode invented about 3 years ago in Germany, now widely
available in the USA. For the user it is very similar to AMTOR but
with several advantages that make it considerably more pleasant to
use. If you have the PK-232MBX, you can get PACTOR by simply buying
the new "firmware" from AEA for $85.00. It comes on two ROM chips
which you plug in to replace of the existing ROM chips in your TNC.
If you don't have the "-MBX" model, you must also upgrade with that
modification, as well.

Contact AEA for full information. Users of TNC's from other manufac-
turers can probably upgrade theirs, also.

> watts dissapation.

Not sure what the hesitation is here. Penta Labs has been in business
for a long long time. They manufactured the PL-172 tube used in the
Hallicrafter's HT-33 amplifiers, and that was a pretty decent tube and
lasted forever...

I have not purchased any of the Penta Labs 572-B or 3-500Z(MP) tubes,
but that is because I have no amp that uses them... and, I am selling
my HT-33 because I hardly ever use the Alpha and having two unused
amps seems a waste when there must be several folks wanting to burn a
bigger hole in the ether! ;^)

>Chuck Harris - WA3UQV

WRONG! The vote must pass by a 2/3 majority with at least 100 more YES votes than NO votes. I'll be surprized if we get more than 3 or 4 hundred votes total (not counting abstentions). This does seem quite fair and I agree that a NO vote should not be cast against groups that the voter really does not care about (would not subscribe to).

> Use "dit" only at the end of a character.

Actually, I believe that while Paul was trying to point out the problems with breaking a Morse character into component elements, and this is one of the greatest impediments to learning Morse, Harv's contribution seems to re-emphasize HOW to make those component elements of the Morse character.

The truth is, that until you associate the sound of the CHARACTER with the character, and remove ALL the "helpful aids" from the equation, learning Morse beyond 8-10 words per minute will be nigh onto impossible. The brain just can not do the table lookup any faster.

Look again at Paul's advice: "Map sounds, no bits." This one hint will make CW possible for more people than one might imagine. There are but 36 numbers and letters, with about 14 punctuation and prosigns, so the table size is but 50 sounds and characters...and, when one hears Morse, and immediately associates it with "C" instead of "dahdidahdit that's a 'C'" the speed barriers tend to fall away.

I would be happy to help and advise people, via e-mail, on CW learning. It is a part of the HF requirements, and rather than stubbornly wait for the rules to change -- which could be never -- why not let an Old Buzzard "elmer" you along so you too can enjoy HF?

I have a 88 Accord LX and have been running 200 watts input power on 20m SSB
for over 5 years without any indication of interference to the car's systems.
This is with a standard Hustler antenna mounted on the left rear fender, and
with power leads directly to the battery.

(My only VHF operation has been with a HT, to a mag mount or with the rubberduck;
again, no problems.)

Yeah, but don't get your metal watch band, or a ring, across that 12 volt
800 amp supply!!! I was working on a project one night and spotted the
trouble, a poor solder joint. I grabbed the grounded tip iron out of the
solder station and started to resolder the joint. POW! I was left holding
a nub of an iron as the 12 volts was direct shorted. You tend to forget
the power is on when it's "only" 12 volts. Don't!

I second the "drill the hole" comment, and the HTX-202 has a good frontend, unlike most other modern HTs, so it'll work without overload on an outside antenna. However, you're still saddled with a loose radio in the car connected to a mess of cables, power, antenna, mic, external speaker, etc. And you'll often need that power amp to be solid into a repeater. It's really frustrating when you can hear everyone, but you're so noisy they can't copy half of what you say. HT internal speakers usually don't have enough volume to use comfortably in a vehicle unless you hold them up next to your ear, so an external speaker is almost essential. Once you've done all that, you probably would have been better off buying a mobile rig to begin with.

You should analyze your operating style. If you want to do mostly beltloop operation, then the HT is for you. But if most of your operating will be in the car, or at home, then a mobile with a quick release bracket is likely a much better choice. You can get a 2 meter mobile for little more than the HT, maybe less after you figure in the amp and external mic and speaker.

2546. Mod question for Kenwood TM741

Newsgroup: rec.radio.amateur.misc
Date: 1993-05-14 14:19:51 UTC
From: brunelle@smoken.enet.dec.com
Message-ID: <1993May14.132509.6856@dbased.nuo.dec.com>
Source record: 281590

Greetings fellow readers,

I am currently looking at performing a MOD to my Kenwood
TM-741A, for cross band repeat.

The mod that I am looking at performing came from a
modification book. It states the following...

1. Open Unit, and locate the Control Board.

2. Locate and cut the green wire on the control board.
The control board is on the body of the radio. The
GREEN wire is located towards the left edge of the
board.

3. Locate and cut resistor R58. R58 is blue colored
and located on the control board.

4. Close Unit.

Has anyone else performed this mod ? And if so, does this
sound right ?

Thanks and 73,
John / KA1FYB

Do you receive any interference FROM the car on your SSB setup? That's where my complaints are with honda. They seem to have shielded the car from RECEIVING interference, but are totally unconcerned about being mobile noise sources...

|>
|> (My only VHF operation has been with a HT, to a mag mount or with the rubberduck;

We found that operating with HTs from the car was not a problem. Switching to a mobile rig with a nice sensitive front end picked up lots of noise from the car.

2550. Problems using gamma match on 440 Mhz

Newsgroup: rec.radio.amateur.misc
Date: 1993-05-14 14:41:17 UTC
From: rossi@VFL.Paramax.COM
Message-ID: <1993May14.144117.13349@VFL.Paramax.COM>
Source record: 281596

I have an old 20-element Cushcraft 70 cm crossed yagi (OSCAR) from the
late 70's that uses a gamma match. I don't think their current models are
like this.

Anyway, I could never get the thing tuned properly. The best I could get
was about a about 2:1 SWR across most of the band. It seemed to work
only "fair" at best.

I am currently not active on OSCAR so I removed one set of elements from the
boom and figured I could used it as a single 10-element yagi for 440 FM.

Again, I can not get the SWR much better than about 2:1 from 440-450 MHz. It
seems to drop very slightly near the top end of the band. It does seem to
have a reasonable amount of gain over a groundplane and appears to be acting
like a yagi should but the high SWR bothers me (and the transmitter) a little.
Nothing I do seems to be able to lower it.

I remember hearing somewhere that there are supposed to be all kinds of
problems using a gamma match on 440. Is appears to be true in my case.
I have used a gamma match on 2 meters and it works great. Any suggestions
of a simple match I could use that might work better on 440? I would like
to keep the driven element mounting configuration the same - if possible.

2551. All inclusive 741 manual. Where is it?

Newsgroup: rec.radio.amateur.misc
Date: 1993-05-14 14:45:52 UTC
From: ccoprfm@prism.gatech.EDU
Message-ID: <97565@hydra.gatech.EDU>
Source record: 281595

Hello,

Some months ago, some people started talking about writing a 'be-all end-all manual' for the Kenwood 741. I was just wondering what ever happened to the project. Anyone heard anything about it?

I've sent mail to the person who was supposed to be compiling this manual, but have not gotten any response.

I'm still VERY interested in getting a copy of this, so if anyone has any information I'd appreciate hearing it....

Thanks & 73,

Monte - KC4GPW

Source record: 281603

I need an old phone patch - something to get 8 ohm audio into the phone line in a clear, high quality manner. I don't need vox capability for an HF rig, meters, switches or any other stuff. Just a simple, small patch or circuit with easily obtainable parts (cheap too) to accomplish this task. If you have an old phone patch laying around you would like to get rid of real cheap or have a circuit that would work, please contact me. The project is for my class at WPI here in Worcester. Chris

2553. Re: question about Radio Shack 2-MTR HT

Newsgroup: rec.radio.amateur.misc
Date: 1993-05-14 14:52:20 UTC
From: marshal@dadd.ti.com
Message-ID: <C70unA.B08@csc.ti.com>
Source record: 281598

Thanks for all the Email and response to my post concerning the Radio Shack 2M HT. I was surprised at the positive comments concerning a Radio Shack product. The only negative comments have been concerning the size and weight of the RS 2M HT, but that performance edge only comes on more expensive units.

I've had two comments that I'll need an external antenna when working from an auto. The BNC extension with suction cups to attach to the windshield just wouldn't get out very well. I've noticed cellular phones with this setup, but the short 1/3 meter wavelength probably doesn't have as much a problem penetrating the auto RF cage. Thanks to Richard Chapman for mentioning the RS 5/8 antenna being too high and suggested looking at the MFG 1/4 wave magnetic mount. I park in a parking garage and Richard has saved me some grief. Is the performance difference between a 1/4 wave and 5/8 wave appreciable in actual use? I do understand that the 5/8 wave has a better radiation pattern, but more importantly the 5/8 wave performs better on a moving object for some reason other than simply the radiation pattern (I remember reading once in ARRL handbook). Does anyone know why?

Does anyone know of a good 2M antenna at a reasonable price for an apartment? How would a mag mount for a car put on top a file cabinet work? What if metal framing was used in the construction of the building, is 2M wavelength attenuated greatly? It seems like it might be attenuated greatly since the HT won't work very well from inside a car.

The interest concerning the rumor of a $200 price has been strong and people want to know when this will happen. I was told by a Dallas RS salesman to watch this Sunday's (16 Mar 93) newspaper for an RS advertisement and also that the sale would only last a week. I don't know if this is just a regional sale, since others have said their local RS don't know about the sale. Note: the possibility of a $200 sale rumor has been corroborated by Val Breault's post. I hope the rumor is true because of the comments to date, I'm starting to drool at the thought of owning the RS 2M HT. I need clean off my keyboard and patiently wait for Sunday. :-)

Regards,
Marshal KB5TRY marshal@asic.sc.ti.com

2554. Armed Forces Radio Day??

Sorry, but what you describe is not a G5RV, it's a variation on a double
Zepp antenna. They do work well, but they're not G5RV's.

2562. YEASU FT-411E REPAIR QUESTION

Newsgroup: rec.radio.amateur.misc
Date: 1993-05-14 16:07:52 UTC
From: krfindla@b8.ingr.com
Message-ID: <1993May14.160752.1566@b8.b8.ingr.com>
Source record: 281335

I wanted to see if anyone on the net has experience opening up a Yeasu 411-E 2-Meter HT. The speaker mike jack on mine has a problem and is sounds like a broken solder connection. There is an intermittent problem with the audio cutting out if the jack is touched at all, this is with the speaker mike removed. The receive light comes on indicating there is audio coming in, and I have to wiggle the speaker mike jacks just right to get the speaker to work.

I was successful in carefully opening up the case. I found two solder connections on the speaker jacks that were broken. I carefully reheated them and they are OK. The problem is that the back side of the circuit board that they are connected to is the same board that has the keypad and speaker connected. I was unable to get that board out to get a look at the solder joints on the speaker mike contacts to the circuit board.

Anybody got experience with this problem. I'm not interested in "freelancing" without a little guidance. I was hoping to make a quick repair, if it turns out to be more than this, I'll just ship it off to my favorite service shop, but I wanted to know whether the repair is major or not since the service shop charges $50.00 an hour plus parts with a 1 hour minimum.

Any one have comments and advice please email me at

krfindla@ingr.com

Thanks and 73, KC4RZW, Kim

1. Its not clear that currently allocated and used frequencies are for sale, but rather the unused microwave and about to be deallocated military frequencies.

2. Why bother?

3. How do you plan to deal with the current occupants? They don't seem to hold much regard for the government so I'd hardly expect that they'll live in fear of the amateur community.

We found this exact waveform in my car with the scope, and did the exact
same thing -- dropped in filters between the rig and the battery (at the rig).

The good news is that, yes, it did take those little scallops out of the
O-scope waveform! :-)

The bad news is that I still get RFI in my receiver... :-(

>experienced similar problems, and if so have the problems been solved?

I use an HTX202 as well, and have never had any interference or intermod
problems. It has quite a sensitive front end, so if anything is making
noise, you'll hear it; in my office it picks up S9 hash over most of
2m, but with some very noisy computers in a steel-frame building,
that's to be expected. It can even hear cable channel 18 (video
carrier 145.25 MHz).

You'll need to shield your computers to use the HTX202 on packet.
Since my (true blue) PC is dead quiet anyway, I haven't had any
interference, though I haven't tried packet with my 202 yet.

There's usually an excellent write-up in the Contest Corral section of QST. You might also want to tune the MARS segments (usually above and below the 75, 40, and 20 meter bands) and listen for stations calling, and announcing their receive frequencies. (Of course, every once in a while you get some mil-spec appliance operator who will call and call for 15-20 minutes on end without announcing his listening frequency, then not understand why no one is calling him, sheesh!).

Scott, since you're near Washington DC, give Dick Forde (K3AKK) a call. He usually helps out with the test at AIR at Andrews AFB. I had the privilege of guest operating there at the phone and RTTY positions during the 1989 event. There's just something about running 10KW (almost full-duplex, with widely separated Collins transmitters and Harris receivers) that can't be beat :-).

It's receiver coverage is limited to 144-148 MHz, which some may consider a liability. Mine's just for packet, so that isn't a problem.

One tip. TNC interfacing is the same as for the Icom 2AT. The two TNC manuals I've seen don't mention the HTX specifically, and the interfacing diagram in the HTX manual is a joke. Then again, those two TNC manuals had different interfacing schematics for the same Icom 2AT...

Radio Shack is now carrying a two channel 1 watt GMRS HT. It is on 2 of the
462 MHZ interstitial channels. It is carrier squelch only. It is xtal
controlled. It is definitely NOT suitable for amateur service.

Ok, I'll rephrase the above: "Abstaining is how we get these groups that pass with 100 "yes" votes, 0 "no" votes (and 40,000 abstentions)."

Did the ratios of yes's to abstentions change all that much?

If you like things mostly the way they currently are, your only choice is to vote "NO" for all of those groups that you don't wish to vote "yes" for. It gives your vote more power.

11 Meters allready includes 144.000 - 148.000 in the New York area.
I guess now, we could say goodbye to 440 also.

> Not sure what you mean here. I'd gladly jump out of a swimming pool and
>grab my 12V, 800A car battery, one terminal in each hand; but I wouldn't

Not me! If you have an open wound on each hand, the 12v battery, in contact with each wound, will kill you just fine. It's the current that kills you; it's your skin's resistance that keeps the low voltages from building up enough current to harm you, usually.

The resistance of the essentially salt water that is beneath your skin is very low. A 12 volt battery can produce more than enough current through damaged skin to disrupt your heart.

Now, you say, "Who would intentionally put a wound on each terminal of a 12 volt battery?"

Well, it might not be intentional. Consider what would happen if your hands were violently propelled into a 12v source, and your skin cut by the 12v sources terminals, or circuitry. It happens to mechanics from time to time, when wrenches slip, or hands get burned and quickly withdraw. (admittedly, the more usual accident is to melt a wedding band, or a metal watch band)

>transmit outside of designated amateur bands.

The short answer is market forces. Hams want to out of band transmission and
are willing to pay for it.

An HT with a wider out of band capability has an edge in marketing. We probably
all know a ham or two who have said, "buy X instead of Y since X has wider out
of band transmit/receive."

Ah, but that limited receiver coverage comes with a MAJOR benefit. The
HTX-202HT has EXCELLENT out-of-band rejection. This drastically improves
its performance in urban areas where intermodulation distortion is a
problem. It is particularly good when used with external antennas. (The
rubber duckies are good attenuators :-)).

Yes, they do sell that radio , but they also have a forthcoming
(when?) 70cm radio much like the HTX-202, according to the guide to
HT's in the CQ "Beginners Guide" magazine, currently available at
newsstands. There is about a 5 column-inch description of the radio
in that article.

>11 Meters allready includes 144.000 - 148.000 in the New York area.
>I guess now, we could say goodbye to 440 also.

Here is what I conclude from this posting:

(1) People in NYC have no regard for the law.

(2)That is a societal problem not likely to get fixed in our lifetimes.

(3) The FCC can't afford to catch the lawbreakers because they are so underfunded.

(4) 2m is thus useless in NYC.

(5) To fix (4), Radio Shack should not sell good radios at a good price because of (1) - (3).

(6) What a sorry state of affairs.

You guys are bemoaning your computer interference to your
HTs with ducky antennas. Gary, and the other people are telling
you to use a real (outside, and high) antenna to cure that problem.
It will. And, it will cure a problem that you are causing me (and
other packeteers). The dreaded HIDDEN TRANSMITTER problem.
If you are close enough to the BBS to get into it on an HT with
a ducky, then you probably cant hear most of the distant packet
stations in your region. And, they can't hear you, either.
But, the BBS, with its high antenna, hears us both, and often
at the SAME TIME. The result is, that neither your packets, or mine,
are decoded, and both systems go into backoff/retry mode.
Throughput degrades. We all lose. The solution is for ALL antennas
to be high, and transmitters running 20 watts minimum. (easy for me,
I'm rich). In packet, the ideal state is for all the systems to be
able to hear ALL the other ones on the frequency (within realistic
limits). Please do what you can to contribute to the health of the
system as a whole, and not just concern yoursef with your own
situation. -pat

All of Cushcrafts 440 mhz antennas that I have have a gama match.

I'll bet your antenna is not cut for the FM portion of the band, but is cut
for the
Satellite portion.

unbelievably better.

>that RS has a BNC extension with suction cups to attach to the
>windshield, would that help? RS had a magnetic mount 2M 5/8 wave
>antenna, has any one had experience with it? Tendency to scratch,
>performance, etc.

I have the RS 2M 5/8 wave mag mount antenna and am very happy with it.
I got it pretty cheap because the local store had marked them down or
maybe marked them incorrectly. They sold out pretty fast.

I have a been able to compare it to a few 1/4 waves and the 5/8 does
much better into distant repeaters. I haven't compared it to other 5/8
wave antennas. The antenna does scratch the paint eventually. This is
worse if your are removing or repositioning the antenna often. I have
an oxidized $99 paint job on a '68 VW beetle, so the scratching doesn't
bother me.

One other thing I like about the antenna is that it is so flexible. I
drive under trees in the forest quite often and the antenna takes this
quite well.

2586. Re: What is circular polarization?

Newsgroup: rec.radio.amateur.misc
Date: 1993-05-14 20:22:23 UTC
From: cvm@zippy.telcom.arizona.edu
Message-ID: <930514132117@nauvax.ucc.nau.edu>
Source record: 281619

I am suprised how many responses there have been to this question. (I started this thread almost two months ago).

There have been many good explanations of circular polarization, but I am still wondering why circular polarization is used. I have heard a couple of explanations:

1 - Cirular polarization is just the result of satellites spinning and has no real benefit.

2 - Circular polarization is intentional and allows ground stations to not worry about the polarization of their antenna because the circular polarized signal will be oriented acceptably at least 50% of the time.

Which of these (if either) are true.

More questions, how does using a circularly polarized antenna help. If #2 above is true, then it a fixed polarized antenna would be acceptable. If this is not true, then how does a circularly polarized antenna know at what rate and orientation to spin the polarization. Does the polarization make one reveloution per wave or does it not matter? It seems that if the polarization of the signal and the receiving antenna were changing at the same rate but were 90 degrees out of phase, then the signal would be missed/lost.

I hope I have worded these questions appropriately. I can visualize circular polarization, but am not sure about the technical terms used to describe it.

In article <9305121559.AA00688@ginzo.wellfleet> ginsburg@wellfleet.COM (Scott Ginsburg) writes:
-I recently purchased a Radio Shack HTX-202 HT and last night discovered
-that the receiver is swamped with noise from both my NCD X Terminal monitor
-and my IBM XT monitor to the point that I'm not sure I could use it on
-packet with my current computer equipment. Has anyone else with an HTX-202
-experienced similar problems, and if so have the problems been solved?

Sounds like what happened with mine. My HTX202 used to open the squelch
(with the knob fully clockwise) whenever it was within 6 feet from a
computer (including, fortunately, the POS terminals at Radio Shack)
I took it in for service (extended warantee), and it came back with
the same problem. Handed it back again, and this time, when it returned
(they changed the CPU and some other illegible stuff), it was even worse.
This time (2.5 months later) I asked for it to be replaced. Their policy
is to replace it only after it can't be fixed the third time, but a few
phone calls to Texas and the local service center convinced the manager
to give me a new one (fresh from the box). The new one works fine, and
only has squelch problems within 6 inches of the monitor.

On the other hand, there are quite a few people who don't have this problem.
Good luck.

/mike

2588. Reprogramming Motorola Cellular Phones (Info wanted)

Newsgroup: rec.radio.amateur.misc
Date: 1993-05-14 20:50:03 UTC
From: hikaru@infodn.rmi.de
Message-ID: <449@infodn.rmi.de>
Source record: 281622
Cross-posted to: alt.dcom.telecom,sci.electronics,rec.radio.amateur.misc

I am looking for information on how to put a Motorola Cellular Phone (International Series 3000) in service/test mode.

The phone is a handheld with a screw on antenna, 2 x 8 character LCD display, 12 key numeric keypad and nine keys labeled:

MR a/c <Dial>
M+ <upArw> <Hangup>
<Pwr> Menu <Vol>

(The <> keys actually have symbols on them, which cannot be reproduced on ASCII terminals.)

This is a GSM phone for the European market but maybe the procedure is the same as on the US models.

Please email any information or send a fax (see below) as I do not subscribe to all the groups.

Thanks in advance!

-Walter

SpaceNews
=========

MONDAY MAY 17, 1993

SpaceNews originates at KD2BD in Wall Township, New Jersey, USA. It
is published every week and is made available for unlimited distribution.

* ARSENE PROBLEMS *
==================
Sources indicate that the ARSENE Amateur Satelite launched last week from
the Kourou Space Center was sending only a weak radio signal after its
deployment on Wednesday. The ARSENE French Amateur Radio club satellite
was one of two deployed by an Ariane rocket that lifted off at 9:56 p.m.
Tuesday (0056 GMT Wednesday).

"The signal is indeed coming from ARSENE, but it is extremely weak and
not serviceable," said Jean Gruau, president of the Radio Amateur Club
de l'Espace. Gruau said his group and space officials were looking at
whether the satellite was improperly oriented or whether equipment was
malfunctioning.

Officials report the Astra-1C satellite of the Luxembourg-based Societe
Europeene des Satellites was functioning normally, however.

[Info via Gustavo, LW2DTZ, AMSAT-LU]

* OSCAR-13 SCHEDULE *
=====================
QST *** AO-13 TRANSPONDER SCHEDULE *** 1993 May 10 - May 31
Mode-B : MA 0 to MA 130 ! Omnis MA 250 - MA 60
Mode-BS : MA 130 to MA 180 !<- S transponder; B trsp. is ON
Mode-S : MA 180 to MA 190 !<- S transponder; B trsp. is OFF
Mode-LS : MA 190 to MA 195 !<- S beacon + L transponder
Mode-JL : MA 195 to MA 210 ! Alon/Alat 210/0
Mode-B : MA 210 to MA 256 ! Move to attitude 120/0, May 31
Please don't uplink to B, MA 180-190. Interferes with mode S.

QST de G3RUH 1993 May 05. Magnetorquing from attitude 180/0
to 210/0 will commence on May 08 [Sat] 2009 utc, orbit 3752/224,

and will continue for 6 perigees. Estimated interim attitudes
will be (accuracy +/- 5 deg): Orbit Alon/Alat 3752 180/+3,
3753 185/+3, 3754 189/+2, 3755 194/+2, 3756 199/+1,
3757 204/0, 3758 209/-1. The new schedule will be uploaded
during mode-L, orbit 3756, so it (only) will contain two
mode-JLS sessions: MA 130-150 and 190-210.

QST de G3RUH 1993 May 05. Mode S will be ON for nearly 3
hours, MA 130 to MA 195. New stations appear daily.
MA 130-180 you will have to endure the coupling from Mode-B
users operating at 145.880 - 145.920 MHz. Either
work between them, use as test signals or go x-band.
MA 180-190 is Mode S transponder exclusive (plus B beacon).
MA 190-195 is Mode S beacon (plus mode-L transponder).
73 de James G3RUH, Graham VK5AGR and Peter DB2OS

* FO-20 SCHEDULE *
==================
The following is the latest Fuji-OSCAR-20 operating schedule:

Mode JA (Analog Transponder Mode ON):

19May93 10:20 UTC -to- 20May93 10:40 UTC
26May93 10:50 UTC -to- 27May93 11:08 UTC

Mode JD (Digital Transponder and Mailbox ON):

Available on all orbits except during those time periods noted above.

* SpaceNews NEWS *
==================
I would like to thank all those who have send letters and other messages
of support to me in the last few months. I have been VERY busy this year
with extra work that has left me little time for much else. I apologize
for not responding individually to each message received. I would also
like to thank all those who forward interesting news items to me every
week. I don't always have the space to include every item, but I do
appreciate receiving them.

In addition, my SpaceNews editing and distribution processes have been
modified in the past several months. For the past five years, SpaceNews
has been written entirely on a Commodore 64 computer. I am now using a
variety of different computers for editing and news gathering, and the
transition seems to have gone well.

>synthesize ham freqs from the chip level? WHY? WHY? WHY?
>
>Just wondering...
>

It's much simpler than you think. Let me see now... where's that
old soap box... Okay, here it is :-)

First of all, there are several major amateur markets in the world.
The US market is _NOT_ the largest, it's the second largest with Japan
coming in first with nearly twice as many hams.

In order for a radio to be profitable, it must be saleable in all of
the worlds major markets. There are perhaps a dozen of them in all.
Each of these markets has a different geography and each one has a
different set of rules and regulations to abide by. In other words,
there's a different band plan for each market.

So, your goal as a radio manufacturer is to design one and only one
chip set which will work for all of the different markets. You do
this in software since it's the easiest way to define arbitrary
(legal) operating limits. Your next goal is to make sure that it
is easy to manufacture units and when it comes time to adjust the
production line for a batch for a different market, all you need to
do is rearrange the pattern of diodes on the CPU board. It costs
no more to rearrange a set of diodes and thus its a manufacturing
success and guess what... we all get to buy incredibly cheap radios.

Well, that's it. Not much of a soap box. But I said that it was a
simple answer....

>abstain as they choose. The amount of work that went into these
>proposals should be appreciated, but is irrelevant to the voting
>process. Let the groups stand or fall on their own merits.

I was just trying to point out that with a standard Usenet vote (with strong majority vote requirements, and significant minority veto power) this could turn into a zero-sum game with 300 yes votes for each group, but 101 no votes. Let's say that there are two sub-interests, one that wants *.homebrew, *.instruction, and *.dx and another that wants *.space, *.digital.tcp-ip, and *.emerg-services (that's the closest to a Code/No-code dichotomy I could think of :-), with each faction numbering 300. So, each sub-interest's newsgroups get 300 votes. However, slightly more than 1/3 (say 101) of each faction can't just live-and-let-live, and vote against the other sub-interest's newsgroups. Both sides are screwed out of the newsgroups they wanted.

I'll clarify what I said previously. If you want a newsgroup, vote yes. If it really doesn't matter to you (i.e. you'll read it if it's available, or you can at least not subscribe to it and feel that you

aren't missing anything), then abstain. Only if you feel it would be detrimental to Usenet, should you vote no.

An abstain is not a yes vote, it is a way of saying, "If 100 people care enough to vote for a newsgroup that I'm not interested in, I will respect their judgement, and not jeopardize its creation by raising a frivolous objection." Think of it as a Usenet variation on the Golden Rule:

"Vote unto other's newsgroups, as you would have others vote unto yours."

Source record: 281624

cvm@zippy.telcom.arizona.edu (Chris Michels) writes:

>1 - Cirular polarization is just the result of satellites spinning and
>has no real benefit.

The spinning causes spin modulation, not circular polarization. They'd have to spin *really* fast to be circularly polarizing a VHF/UHF signal. But think about what would happen if they used linear polarization? At some points in time, your receiving antenna (assuming it is also linearly polarized) and the satellites antenna would be aligned properly and you'd get the most gain. Now the satellite rotates 1/4 turn and now the antenna's signal is 90 degrees rotated from your receiving antenna. There would be around 20 dB drop in signal strength! That would make for some severe QSB.

With circularly polarized signals, the signal's polarization remains the same no matter how much the satellite rotates (as long as the axis of rotation and the forward lobe of the antenna are aligned.) So no QSB, at least do to polarity shifts.

>2 - Circular polarization is intentional and allows ground stations to
>not worry about the polarization of their antenna because the circular
>polarized signal will be oriented acceptably at least 50% of the time.

Close, the signal will be acceptably oriented 100% of the time, provided the main lobe of the antenna is pointing towards your station. Another way to say that is the squint angle (or off point angle) is very low. When working a side lobe of the satellite, then the polarity may reverse which is why you sometimes get a better signal with an antenna that can switch between left hand and right hand circular polarization. You tend to get greater spin modulation when working a side lobe because there will be nulls between the side lobes that are aimed your direction when the satellite rotates. This typically means that during the early and late portions of the orbit, the spin modulation is greatest and the polarization is often reversed.

>More questions, how does using a circularly polarized antenna help. If
>#2 above is true, then it a fixed polarized antenna would be acceptable.
>If this is not true, then how does a circularly polarized antenna know

>seems that if the polarization of the signal and the receiving antenna
>were changing at the same rate but were 90 degrees out of phase, then
>the signal would be missed/lost.

Hmmm lets see how to describe this. The signal makes one complete rotation in one cycle, so the satellite doesn't "spin" the polarization, the signal is polarized. The satellite could use a linearly polarized antenna and generate circular polarization if it managed to rotate and the frequency of operation. That would be pretty fast ;-)

You can use a linearly polarized antenna on your ground station and take a 3 dB loss since only half the signal will be polarized correctly.

>I hope I have worded these questions appropriately. I can visualize
>circular polarization, but am not sure about the technical terms used to
>describe it.

I hope I've described it in easy enough terms (and haven't introduced any inaccuracies.)

2596. WARNING: Potential Satellite Proton Event Warning

Newsgroup: rec.radio.amateur.misc
Date: 1993-05-14 23:57:27 UTC
From: oler@rho.uleth.CA
Message-ID: <9305142357.AA27527@rho.uleth.ca>
Source record: 281519

/\

POTENTIAL SATELLITE PROTON EVENT WARNING

ISSUED: 23:50 UT, 14 MAY

/\

ATTENTION:

An interesting class M4.4 tenflare is in progress from Region 7500
(N11W50). This event has been associated with a 970 sfu tenflare that began
at 14/2244Z and a Type IV sweep. X-rays from this event are particularly
interesting. The event began with a sharp impulsive precursor that peaked at
an M1.2 level. This was followed by a gradual decline prior to the main phase
which reached a maximum M4.4 x-ray level at 14/2302Z in a long-decay x-ray
signature.

Overall, this has been an impressive event with a respectable integrated
x-ray flux. There is some concern that the position of this flare, combined
with the characteristics it has exhibited and the coronal geometry around
Region 7500, might be associated with a minor injection of protons at greater
than 10 MeV. If true, an enhancement in protons at greater than 10 MeV in the
near-Earth space environment could be observed over the next 6 to 9 hours (by
approximately 06 to 09 UT on 15 May), with emphasis on possible proton
arrival over the next 3 to 6 hours. The probability of protons exceeding
event levels of 10 pfu at greater than 10 MeV is relatively low, but is high
enough to warrant this warning.

Use the Internet command: "finger solar@xi.uleth.ca" for current plots
of protons at greater than 1, 10 and 100 MeV.

** End of Warning **

: xx feet of coax and most say not to use a balun.

IMHO the coax length requirement is pure witchcraft. The length of
the coax will make no difference if there is no feedline radiation.
Of course, there likely WILL be feedline radiation since you are feeding
a balanced antenna with unbalanced coax, but the proper length of coax to
reduce unwanted shield currents is hard to determine -- it will depend on
how your equipment is hooked up and grounded. If feedline radiation
causes problems, just add a current-type balun between twinlead and coax.

I have been using an HTX 202 on packet for quite a while and have had no problems with my home computer whitch is an 425 SX factory direct(or a GRID same thing). I have found a problem using it for portable packet with a laptop because of the RF interference and to fix it the antenna needs to be about fifteen to twenty feet away from the laptop.

>Did the ratios of yes's to abstentions change all that much?

I think we're still miscommunicating on something here. It is possible to abstain on a single newsgroup while casting votes for the ones you have an opinion on. The ballot form in the CFV allows for separate votes on each newsgroup consisting of yes, no, or abstain. The voting form on the CFV has an example for each of yes, no and abstain.

No one is suggesting that anyone entirely abstain/refrain from voting. (Is that what you meant by 40000 abstentions?)

BTW, I've received a bunch of requests for copies of the CFV by e-mail. (Some people or sites may have missed it.) To save me some time from manually sending it each time, I've made a mail-in program that will send a copy of the official CFV as posted by David Lawrence (moderator of news.announce.newgroups.) The script that sends the reply will not read your mail so you don't need to say anything in it. Just send a message to
cfv-request@uts.amdahl.com
and the script will send you a copy.

:
: Yes, they do sell that radio , but they also have a forthcoming
: (when?) 70cm radio much like the HTX-202, according to the guide to
: HT's in the CQ "Beginners Guide" magazine, currently available at
: newsstands. There is about a 5 column-inch description of the radio
: in that article.
:
The manager of one of the local RS's is more friendly than the average, and
a couple of days ago, I asked him about this. He didn't know anything about
it, but then I told him that someone had said they had seen the price tag
for the new radio, so he quite obligingly got out his box of spare pricetags,
and we looked it up. (I think I even had the RS "part number", but can't
recall it now.) Anyway, from the "bullets" on the pricetag, it looks to
be the 70CM version of their current 2M radio: 16 memories, ham-band-only
recieve, same accessories, and a price of $299.95.

No info, though, on the availability. (However, it doesn't make a lot of
sense to me that they would put out the price tag very much in advance of
putting out the radio, but then again, I've never been involved with RS
other than as a cus(s)tomer.

I saw a quick release bracket with connections for antenna and DC, so you don't have to unplug from the back, just pull them all out, but it has a "thing" on top of your rig, I thought of using this so I can have the mobile to be used at home also, but the price is very high: $150 (CDN) for both sides, and if I want another mount, more money. I know the Radio Shack ones are like $20 or so, but I need to unplug the plugs on the back, what other alternatives?

>a 2 meter mobile for little more than the HT, maybe less after you
>figure in the amp and external mic and speaker.

I was thinking about using external amps, but for a dual-bander HT to have amps, you need 2 amps, with band-splitter (and probably 2 antennas) for a full duplex on cross-band, and that's expensive!

Someone told me it looked and had the same features as the HTX-202 (Which I consider to be a great HT), only on 440. I believe my local RS has one in stock, and I think I'll drive down and check it out tomorrow.

To all radio amateurs

SB QST ARL ARLB054
ARLB054 Fake SOS brings sentence

An Amateur Extra class licensee has been sentenced for making fake
distress transmissions on 14.313 MHz.

Fifty-year-old Jorge Mestre, NS3K, of Fairfax, Virginia, had pled
guilty in February to knowingly and willfully communicating false
distress signals on August 7, 1992. At that time he made a plea
agreement to surrender his FCC amateur license, dispose of his
Amateur Rdio equipment within 60 days, and make immediate
restitution of 50,000 dollar(s) to the U.S. Coast Guard.

At sentencing in U.S. District Court in Alexandria, Va., Mestre was
given one year probation on condition of his serving 60 days home
confinement, ordered to perform 200 hours of community service, and
to pay a 50 dollar special assessment.

Mestre could have received a fine of up to 250,000 dollar(s) and up to 6
years imprisonment.

More information is in April, 1993 QST, page 79.

: but 101 no votes. Let's say that there are two sub-interests, one that
: wants *.homebrew, *.instruction, and *.dx and another that wants
: *.space, *.digital.tcp-ip, and *.emerg-services (that's the closest to a
: Code/No-code dichotomy I could think of :-), with each faction numbering

I think that is an incredibly arbitrary split. It only goes to show that there is really no difference between proponents of new code requirements and those who are either reactionary or in favor of the status quo. (Except that one subject naturally ;-) Being one of those who think there should be some change in the code requirements I voted for two of the groups in your 'coded' segment and only one in your 'no-code' segment. I am assuming (dangerous I know) that the group including *.dx is the code group.

The problem with the grouping as I see it isn't that I don't want to see discussion about TCP/IP, for example it's just that I think it can be better handled by the current packet group. In short many no votes aren't votes against the topic just against the continual splitting.

: aren't missing anything), then abstain. Only if you feel it would be
: detrimental to Usenet, should you vote no.

Wrong!

: An abstain is not a yes vote, it is a way of saying, "If 100 people care

You're right its 1/3 a no vote and 2/3 a yes vote.

:
: "Vote unto other's newsgroups, as you would have others vote unto
: yours.

I wish everyone would vote for my groups does that mean I should vote for all the groups? No!

: I hope you appreciate this bullet I took for you, Ian! :-)

Hope you appreciate the second one too! ;-)

Dan

BTW: trying to divert replys to a different newsgroup to avoid other peoples opinions from being heard is BAD form! Or maybe everyone on r.r.a.misc also read news.groups. don't deny others the same audience you have.

To: nagle@netcom.com
Subject: Re: Experience with Ramsey kits?

John, could you post this to rec.radio.amateur.misc
for me? We're having trouble getting out here. Thanks....

As it happens, I just put together a Ramsey 2M transceiver kit. Observations:

* The instructions were _Excellent_, nearly as good as a Heathkit. Somebody over there is a real electronics missionary, and you are told in detail how everything works, and what the parts are for. As much as possible, you get to test each small section after building it. For example, the first things you stuff are the 3-terminal regulators, after which you are told to power the card up and check the voltages. The board was silk-screened with the component designations, there is a full-page pictorial, and a full-page schematic. Also they supply a stuffing diagram and partial schematic for each subsection, to use as you stuff it.

* There were a couple of missing small-value caps, and one missing Inductor. My junkbox yielded replacements for the caps, and the local electronics surplus house yielded the inductor.

* The receiver came up immediately, with no fuss. I did have to change a cap across the synthesizer crystal to get it on frequency, though. Since the oscillator was on 10.24 MHz, I was able to use my HF rig to listen to the crystal and get it spot on.

* I had some trouble getting the transmitter section working; No RF was coming out of the final amp. I sent Ramsey a fax describing the problem, and I mentioned the missing inductor. About 15 minutes later an answering fax came in, with a good guess as to my problem, and a promise to send me an inductor. The Ramsey engineer's guess was correct, BTW; a solder short under the final transistor. After fixing that, the transmitter came up immediately.

* I bought the optional case. It was very nice indeed; a two-part clamshell case done in heavy gauge steel, with black anodized front and rear panels..

In conclusion, I'd have to say that while there were a few parts missing, I would have no hesitation about buying another Ramsey kit. In fact, I'm ogling the 440 transceiver right now :-). Of course, one doesn't buy electronic kits to save money; I could easily score an HT at the swap

meet for the same amount. But I like to build stuff. Also, I plan to use it on packet, maybe 9600baud. And digging into an HT to try to get at the discriminator and modulator is not my idea of fun hobby stuff! These transceivers have a packet connector on the back, and direct access to speaker audio, discriminator audio, or IF output, your choice. In fact, since the board is nicely spread out, so you have easy access to _ANY_ place in the circuit that you care to tack a wire to.

Changes: Added description of rec.radio.info

(Note: The following is reprinted with the permission of the author.)

This message describes the rec.radio.amateur.*, rec.radio.cb, rec.radio.info,
and rec.radio.swap newsgroups. It is intended to serve as a guide for the new
reader on what to find where. Questions and comments may be directed to the
author, Jay Maynard, K5ZC, by Internet electronic mail at
jmaynard@oac.hsc.uth.tmc.edu. This message was last changed on 27 January
1993.

History
=======

Way back when, before there was a Usenet, the Internet hosted a mailing list
for hams, called (appropriately enough) INFO-HAMS. Ham radio discussions
were held on the mailing list, and sent to the mailboxes of those who had
signed up for it. When the Usenet software was created, and net news as we
now know it was developed, a newsgroup was created for hams: net.ham-radio.
The mailing list and the newsgroup were gatewayed together, eventually.

As the net grew, and as packet radio came into vogue, packet discussion began
to dominate other topics in the group and on the list. This resulted in the
logical solution: a group was created to hold the packet discussion, and
another corresponding mailing list was created as well: net.ham-radio.packet
and PACKET-RADIO, respectively.

These two groups served for several years, and went through Usenet's Great
Renaming essentially unchanged, moving from net.ham-radio[.packet] to
rec.ham-radio[.packet]. Readership and volume grew with the rest of the
network.

The INFO-HAMS mailing list was originally run from a US Army computer at
White Sands Missile Range, SIMTEL20. There were few problems with this
arrangement, but one was that the system was not supposed to be used for
commercial purposes. Since one of hams' favorite pastimes is swapping
gear, it was natural for hams to post messages about equipment for sale
to INFO-HAMS/rec.ham-radio. This ran afoul of SIMTEL20's no-commercial-use
restriction, and after some argument, a group was created specifically
for messages like that: rec.ham-radio.swap. This group wasn't gatewayed to
a mailing list, thus avoiding problems.
```

While all this was happening, other folks wanted to discuss other aspects of the world of radio than the personal communications services. Those folks created the rec.radio.shortwave and rec.radio.noncomm newsgroups, and established the precedent of the rec.radio.* hierarchy, which in turn reflected Usenet's overall trend toward a hierarchical name structure.

The debate between proponents of a no-code ham radio license and its opponents grew fierce and voluminous in late 1989 and 1990. Eventually, both sides grew weary of the debate, and those who had not been involved even more so. A proposal for a newsgroup dedicated to licensing issues failed. A later proposal was made for a group that would cover the many recurring legal issues discussions. During discussion of the latter proposal, it became clear that it would be desirable to fit the ham radio groups under the rec.radio.* hierarchy. A full-blown reorganization was passed by Usenet voters in January 1991, leading to the overall structure we now use.

After the reorganization, more and more regular information postings began to appear, and were spread out across the various groups in rec.radio.*. Taking the successful example of the news.answers group, where informational postings from across the net are sent, the group rec.radio.info was created in December, 1992, with Mark Salyzyn, VE6MGS, initially serving as moderator.

The Current Groups

I can hear you asking, "OK, so this is all neat history, but what does it have to do with me now?" The answer is that the history of each group has a direct bearing on what the group is used for, and what's considered appropriate where.

The easy one is rec.radio.amateur.misc. It is what rec.ham-radio was renamed to during the reorganization. Any message that's not more appropriate in one of the other groups belongs here, from contesting to DX to ragchewing on VHF to information on becoming a ham.

The group rec.radio.amateur.packet is for discussions related to (surprise!) packet radio. This doesn't have to be the common two-meter AX.25 variety of packet radio, either; some of the most knowledgeable folks in radio digital communications can be found here, and anything in the general area is welcome.

The swap group is now rec.radio.swap. This recognizes a fact that became evident shortly after the original group was formed: Hams don't just swap ham radio gear, and other folks besides hams swap ham equipment. If you have radio equipment, or test gear, or computer stuff that hams would be interested in, here's the place. Equipment wanted postings belong here too. Discussions about the equipment generally don't; if you wish to discuss a particular posting with the buyer, email is a much better way to do it, and the other groups are the place for public discussions. There is now a regular posting with information on how to go about buying and selling items in rec.radio.swap; please refer to it before you post there.

The reorganization added two groups to the list, one of which is rec.radio.amateur.policy. This group was created as a place for all the discussions that seem to drag on interminably about the many rules,

regulations, legalities, and policies that surround amateur radio, both existing and proposed. The never-ending no-code debate goes here, as does the New Jersey scanner law, the legality of ordering a pizza on the autopatch, what a bunch of rotten no-goodniks the local frequency coordinating body is, and so on.

The other added group is rec.radio.cb. This is the place for all discussion about the Citizens' Band radio service. Such discussions have been very inflammatory in rec.ham-radio in the past; please do not cross-post to both rec.radio.cb and rec.radio.amateur.* unless the topic is genuinely of interest to both hams and CBers - and very few topics are.

The rec.radio.info group is just what its name implies: it's the place where informational messages from across rec.radio.* may be found, regardless of where else they're posted. As of this writing, information posted to the group includes Cary Oler's daily solar propagation bulletins, ARRL bulletins, the Frequently Asked Questions files for the various groups, and radio modification instructions. This group is moderated, so you cannot post to it directly; if you try, even if your message is crossposted to one of the other groups, your message will be mailed to the moderator, who is currently Mark Salyzyn, VE6MGS. The email address for submissions to the group is rec-radio-info@ve6mgs.ampr.ab.ca. Inquires and other administrivia should be directed to rec-radio-request@ve6mgs.ampr.ab.ca. For more information about rec.radio.info, consult the introduction and posting guidelines that are regularly posted to that newsgroup.

The rec.radio.amateur.misc, .packet, and .policy groups, and the rec.radio.info group, are available by Internet electronic mail in digest format; send a mail message containing "help" on a line by itself to listserv@ucsd.edu for instructions on how to use the mail server. The rec.radio.swap group is not available by electronic mail; the gateway that was formerly available for posting at ucbvax.berkeley.edu has been shut down for all but users at UC Berkeley.

A Few Words on Crossposting
==========

Please do not crosspost messages to two or more groups unless there is genuine interest in both groups in the topic being discussed, and when you do, please include a header line of the form "Followup-To: group.name" in your article's headers (before the first blank line). This will cause followups to your article to go to the group listed in the Followup-To: line. If you wish to have replies to go to you by email, rather than be posted, use the word "poster" instead of the name of a group. Such a line appears in the headers of this article.

One of the few examples of productive cross-posting is with the rec.radio.info newsgroup. To provide a filtered presentation of information articles, while still maintaining visibility in their home newsgroups, the moderator strongly encourages cross-posting. All information articles should be submitted to the rec.radio.info moderator so that he may simultaneously cross-post your information to the appropriate newsgroups. Most newsreaders will only present

the article once, and network bandwidth is conserved since only one article is propagated. If you make regular informational postings, and have made arrangements with the moderator to post directly to the group, please cross-post as appropriate.

Advantages of circular polarization, in no particular order.

Less crosspolarization loss when working with linear polarized signals on the other end. You can suffer as much as 30 db cross polarization loss between two linear polarized antennas if one is 90 degrees to the other (IE horizontal and vertical). If one of the antennas is a CP antenna, then the loss is only 3 db. A way to view CP is two right angle polarized vectors with equal strength. So there's 3 db less horizontal than a HP signal, and 3 db less vertical than a VP signal. Absolute phase doesn't matter to LP antennas. Of course there's *always* a 3 db loss compared to two antennas which are *not* cross polarized when one of the antennas is CP and the other is not. With a spinning satellite, this is usually a big win since ilinear polarization would be continously changing with spin. If both ends use CP of the same sense, minimum losses are incurred.

A related topic; spin modulation. If linear polarization is used, a spinning satellite's signals will be amplitude modulated by the spin rate due to the varying cross polarization loss mentioned above. This will result in a very annoying pumping of the satellite's signal at a low audio rate. If both ends use CP of the same handedness, then the spin modulation will disappear (assuming both antennas are boresighted, if not, squint angle enters in and introduces elliptical polarization to the signals). Note that CP signals "revolve" in phase every cycle of the waveform. That's millions of times faster than the spin of the satellite so that if the antenna senses match, the only result of the satellite's *mechanical* rotation is a *tiny* phase modulation of the signal much too slight to detect.

Another advantage of circular polarization is reduction of multipath problems, or ghosting as we call it in the TV business. When a CP signal is reflected, it's "handedness" reverses. (IE a right hand circular signal will become a left hand circular signal when reflected) Because signals of different polarization sense, handedness in this case, will suffer the 30 db cross polarization loss, this will reduce the received strength of multipath signals (reduce ghosts). Note to take advantage of this both antennas must be CP of the same sense.

In some cases, especially at microwave, a bounce signal may be the strongest of the multiple signals reaching the receiver. In that case, reversing the sense of the receive antenna will give better reception. We take advantage of this a lot with mobile microwave relays of live news events in urban areas. We often select a tall building and bounce the signal off of it rather than trying to burn through the clutter with a direct shot. Switchable polarization sense is a must. We can also select horizontal or vertical polarization for the times we must "knife edge" diffract over or around an obstacle.

>system as a whole, and not just concern yoursef with your own
>situation. -pat

Pat's right in his description of the problem. His proposed solution is *one* approach to solving it. Another approach is to eliminate the hidden terminals via a duplex repeater (like voice) so everyone hears what the repeater hears. If you can get a repeater per MAN coordinated, this works great. A third approach is to eliminate the *exposed* terminals, the high sites, and have *everyone* run low power and low antennas. This quasi-cellular approach requires many more relay hops for the typical circuit, and assumes a packet station density far greater than in many areas, and a 24 hr on air time for every station, but it can work too if the network is planned carefully. Network latency is higher however.

The *worst* situation is simplex high sites combined with HT and poor antenna low sites. This is packet hell for everyone trying to use the channel.

> out by filing a waiver.

True there exists no speed requirment in an international sense.
Actually these are International Agreements. International Law is a
very gray area. There does not really exist any true enforcing body.
The UN may be construed by some in this way but it is more of a political
body. I suppose code could fall under the Laws of the Seas which are
infact International Law. But I am not sure on that. International
Agreements were more loosely writtne so that each state could set
certain standards which they felt were appropriate. But the fact still
stands that Morse Code according to the international community is still
an important means on communication on the HF frequencies. The IARU
just reaffirmed this too.

> I didn't realize it wsa against the unwritten code to help other amateurs
> with solder jobs etc that they are unable to do for themselves.

You missed the point entirely. It is one thing to help an amatuer with
a solder job. I often do this myself. But he was making a point that
it is a sad state of affairs when an amateur cannot even put a connector
on coax. IT IS NOT DIFFICULT! This should be able to be accomplished
by any license class right down to novice. Geez, get an ARRL handbook
and follow it's intructions for putting on a connector. It is pretty
clear if you can read English. Mybe they are nervous of messing up but
that's ok too. That's how a person can learn sometimes...by their
mistakes. It's not like coax is very expensive.

JJust yesterday on my way to work I was listening to two amateurs talk
about mulit-mode data controllers. One was affraid to install his new
MFJ 1278 because he couldn't figure out how to make a cord for keying
the tx or receiving audio. Now come on folks. That is really sad. It
is very very very basic. Any amateur (in theory) should be able to
accomplish such a task. But in true "modern" amateur fashion he is
going to opt for the "pre-made" MFJ cord. I can't blame MFJ, they are
just providing a product where there there is a market for it. Just
READ people. That's all I ask.

> Gee there really are some extras on 2mtrs. :-) There are people that
> don't know much about electronics of all license classes. Help teach them.
> Quit yer whining.

This is also very true. Thanks to the joke exams and the inability of hams to read and LEARN. It's like the minute some people get an extra class license, they think they are all done now. It should be only the beginning. One's education is never over.

> Many people are violently against the right thing look at the freedom
> riders in the south. I'm not drawing a direct comparison but realize that
> just because a majority of a group want something to happen means that is
> the right thing.

OH really! I would have to disagree with you there. So you could also justify that argument in South Africa. Couldn't you? Being that we are a democracy what the "people" want is always the RIGHT thing. Whether or not that causes harm to ourselves at some point is of lesser importance. We cause more harm to ourselves by abandoning our belief in majority rule.

> I would bet that if the FCC gave some people authority to do something
> about the problems they would get better, especially if the Hams were
> given privledges there again. That way we'd out number the lids. And a
> few pink slips and some good RDF cleans the bands up pretty well.

I can agree with you there. The FCC has a very hands off approach to the amateur radio service. There is some token involvement but it is very rare. If we are to be self policing we need some teeth in OO's authorities. Nobody likes lids.

You made one point which I failed to quote. But yes, Better ELMERS would mean better New Amateurs. DOing a favor for a ham friend is one thing, ie coaxial connector, but you need to teach them how to do it themselves for the next time.

It seems a bunch of people think SBS sites only bash. We practice what we preach here in RI. We are part of an 2 meter FM code practice net and also work with the Ocean State Amateur's Net which attempts to answer any and all questions amteurs have regarding policy, theory, or operating tips. We especially encourage new amateur's to check in every week. Yes, we unsing SBS sites might seem critical but we practice what we preach! I am not some P.C. wishy washy ham who likes to see things going down the toilet like they are.

The radio that Mark is talking about is a new 70cm HT. I recently saw
a blurb in a magazine under the "New Products" section. It does sound
like a 70cm version of the 2M radio. The price they gave however, was
around $260.00, just like the 2M. The article didn't offer very much
information on this radio or when it will be available.

Well I don't consider $500 a reasonable price for a 2 meter mobile
either, a dualbander maybe, but not a 2 meter only radio. Try the
Alinco DR-130T for $309. It's a *50* watt mobile rig with CTCSS,
scanning, etc just like the high priced spread. You're going to
spend that much for the RS HT and a 30 watt power amp.

>within.

If you want to change the situation in Cuba, move there and vote against Castro. Might work if you could find enough people willing to do it, but in the absence of a clear, mass movement to do so, people like me will NOT join because our single votes will NOT change the status quo without that mass movement.

>RI... ask LOTS of hams who have been licensed since BEFORE the
>incentive licensing program nearly made us all extinct...and check

A good example of why joining and voting won't work. As I remember, the vote within the ARRL itself was overwhelmingly against incentive licensing. Incentive licensing, the very thing that's depleted our numbers and aggravated so many people, was a creation of the ARRL exclusively, and was almost universally opposed by hams of the time. Out of the hundreds of QSOs I had during the time, and the thousands I listened to, I heard exactly ONE person say something favorable about incentive licensing.

>your percentages again....closely...people with memories and no desire
>to repeat the stupidity of 1968 are pretty well in favor of the
>licensing scheme that permits licenses without a CW requirement...

Thanks to the ARRL, everyone's now favoring removing a method of communication that, while other better forms are available, can still be essential. As someone else said in another article, you may only really need CW once... but that one time, you'll REALLY need it. I've been there. I used to be able to depend on 400,000 people available who understood it just in case I needed to communicate with it; now I have a mental picture of people standing around asking, "What's that strange beeping noise?"

>that these new hams are upgrading, at the rate of nearly 2 of every 3,

Thank goodness!

I do have to say that I once bought a Ramsey DVM because it was inexpensive.
For years, it took a good beating. I eventually replaced it with a Fluke 77,
but while I had both I compared the accuracy with various sources; the Ramsey
was +- 1 digit from the reading of the Fluke in all cases.
VERY respectable performance for an inexpensive piece of test equipment.

BTW, I gave the Ramsey to someone who uses a voltmeter less; it's about
ten years old, still accurate and still chugging along.

There is a simple rule that I've always followed (well, ever since the
time I got hit by 660 VDC...luckily enough, even then I knew to keep one
hand well out of the way so it wasn't across the chest). The rule is,
when dealing with large power supplies, always assume that it is capable
of a painful, if not lethal, jolt. When I work with the 12 VDC, 25 Amp
power supply for my HF rig (i.e., adding something else on to the supply's
terminals), I *ALWAYS* turn off the supply before doing anything else. I
usually don't discharge the caps, and one day, I'll no doubt pay for that
carelessness, too.

Better safe than sorry, right?

btw, on a related note, when I was still in school, during one of our
trips to a telephone C.O., the tech who was showing us around the battery
room (for those who don't know, the telephone network is powered by huge
-48 VDC batteries) mentioned that one time, someone accidentally dropped
a rather large wrench across both the negative and ground bars between
the batteries and the switch...the wrench (all 3 pieces of it) never even
slowed down as it melted and passed right through those power bars.

That's the way.

Wonder, though, if everyone will vote for his/her favorite aspect of the
obby, nixing or abstaining on voting for those groups he/she is not
interested in? Further, if this happens, will we end up like the
parliaments in some country where nothing passes and governments
rise and fall with the sun because no one can put together a
majority on anything? :-) :-) :-)

Such as the fact that (based on my usage so far), it's *VERY* bulletproof.
We're talking someone tuning up right on top of a QSO I was in, and it had
no apparent impact at all, even though the carrier was considerably
stronger than the person I was working on PacTOR. Also, it seems that it's
a lot less sensitive to QSB than normal AMTOR, too.

Put it this way...right from the very start, I've been impressed as h*ll
with PacTOR. :-)

>If you have the PK-232MBX, you can get PACTOR by simply buying
>the new "firmware" from AEA for $85.00.

Kantronics provides an upgrade for the KAM, as well (this is how I got
on PacTOR). Basically, it's the version 6.0 firmware.

:>:
:> Not sure what you mean here. I'd gladly jump out of a swimming pool and
:>grab my 12V, 800A car battery, one terminal in each hand; but I wouldn't
:
:Not me! If you have an open wound on each hand, the 12v battery, in contact
:with each wound, will kill you just fine. It's the current that kills you;
:it's your skin's resistance that keeps the low voltages from building up
:enough current to harm you, usually.
:
:The resistance of the essentially salt water that is beneath your skin is very
:low. A 12 volt battery can produce more than enough current through damaged
:skin to disrupt your heart.

From the Merck Manual, Fourteenth Edition, page 2134:
"Dry, well-keratinized, intact skin may have a resistance of several hundred thousand ohms, whereas the resistance of moist, thin skin is about 500 ohms. If the skin is punctured (e.g., from a cut or abrasion, or by a needle), or if current is applied to moist mucous membranes (e.g., mouth, rectum, vagina), the [body] resistance may be as low as 200 to 300 ohms."

12V / 200 ohms = 60 mA.

Again, ibid.:
"The maximum current that can cause contraction of the flexor musculature of the arm but still permit the subject to release his hand from the current source is termed the _'let-go' current_. For DC this value is about 75 ma...

"... can induce _ventricular fibrillation_ at [AC] currents as low as 60 to 100 mA; about 300 to 500 mA of DC are required."

I rest my case. (I've taken an interest in these things since I began my work history as a TV technician, 27 years ago. Just in case...)

:Now, you say, "Who would intentionally put a wound on each terminal of a 12
:volt battery?"
:
:Well, it might not be intentional. Consider what would happen if your hands
:were violently propelled into a 12v source, and your skin cut by the
:12v sources terminals, or circuitry. It happens to mechanics from time to
:time, when wrenches slip, or hands get burned and quickly withdraw.
:(admittedly, the more usual accident is to melt a wedding band, or a metal
:watch band)

It's usually a combination of the bright spark (scary, makes you jump)
and the instantaneous heat of shorting such a high-capacity battery that
makes the mechanic withdraw, not the current.
Believe me, I've both wet my arms and chest and held the battery
terminals as a demonstration, I've also had the misfortune of shorting
a battery with a wrench, screwdriver, jack-handle, etc. Having had both
experiences, I'd rather swim with the batteries. Especially because of the
danger of explosion inherent in shorting the terminals of a non-sealed
lead-acid battery (which generates copious amounts of hydrogen in the
presence of a massive spark)!

> hermetically sealed state of mind called Rhode Island. Had you stated
> your premise that the majority of licensed US hams were not members of
> the American Radio Relay League, you'd have been correct.

Wrong you are! I stated that perfectly. Yes the ARRL may be the only
defacto representative body. But the fact still remains that the ARRL
does NOT represent a majority of amateurs. I have lived in several
states my friend. Two of which are New Hampshire and Maryland. I have
also traveled abroad. I DO have much knowledge (increasingly more) of
the "outside" world.

> However, as
> far as the Federal Government (US) and the various International
> Governments who collectively make the world-wide rules... The ARRL
> *IS* the representative body for US Amateur Radio. Hands down. No
> arguement. NO COMPETITION. The ARRL is THE representative body.

A competitive body is not necessarily the answer. However keep in mind
that the ARRL is a BUSINESS. They are a publishing house. PERIOD. No
ARGUMENT THERE! They represent themselves and their business. Yes I
have supported things the ARRL has taken a stance on. However they put
thier publishing business first on the no-code issue.

> As an Old Buzzard, who has been around this pole a helluva lot more
> often than you have in your tender 24 years on the planet, I think you
> are way off base,

So because you are an "old buzzard" means your facts are valid. WRONG!
I have researched the topic and know personally many many hams who have
been licensed before incentive licensing. I incorporate their opinions
as part of my statements. In my "tender" 24 years on this planet I have
done more than many other "old buzzards".

> go broader...out of
> RI... ask LOTS of hams who have been licensed since BEFORE the
> incentive licensing program nearly made us all extinct...and check

Already answered.

> ...closely...people with memories and no desire
> to repeat the stupidity of 1968 are pretty well in favor of the
> licensing scheme that permits licenses without a CW requirement...

Maybe in your circle of friends you actually believe this to be true.
Incentive? Oh my gosh. We can't have that "stupidity" now. It's too
hard. Well your breed has helped to make American psyche weak. Gimme
Gimme Gimme.

> that these new hams are upgrading, at the rate of nearly 2 of every 3,
> should take a great deal of the arguement out of you.

You just killed your previous statement that incentive was stupidity. If
in fact 2 out of 3 no-code beginners do upgrade to a coded status then
the incentive DID work. But didn't you say that was stupidity?

> ... but like so
> many who like to believe they are educated because of a college
> degree... you will no doubt sputter on, further proving ignorance is
> no filter for anything...

Yes college did provide me with a basis of education which I have
continued to build on. But like so many who believe they are educated
becuase they are an "old buzzard", you will no doubt sputter on proving
ignorance is no filter for anything. See...it goes both ways doesn't
it? Rememeber a man without an education is NOTHING! I hope you are
more than that? I am educated because I collect, analyze, and formulate
my own ideas, then I test them. I aim to do this for every facet of my
life. College helped me to develop the skills necessary to accomplish
this.

You see Jack, I love this lively debate. I may respect other people's
views but I have have my own which often differ with other PC people.

Yeah - although it's a bit of an exaggeration because computer
power supplies typically do provide that kind of amperage, I tell
my digital design classes to be careful about the 5 v supply -
it won't electrocute you but watch out for melting screwdrivers :-)

2627. DJ580 mods?

Newsgroup: rec.radio.amateur.misc
Date: 1993-05-15 22:59:52 UTC
From: btoback@netcom.com
Message-ID: <btobackC73Bvs.D5F@netcom.com>
Source record: 281481

Since the last time I bought a VHF/UHF radio (a Standard C21 in
1983, a year before my licence lapsed), a lot has changed. It appears
that today's handhelds are a lot more capable, given a few modifications.

I've about decided, on the strength of a number of recommendations,
to buy an Alinco DJ-580. (My new ticket should be in the mail by
now.) Does anyone know if the DJ-580 can be modified to transmit on the
aircraft band?

WAIT! Before you get out the flamethrower (which a number of people
did when I originally asked for aircraft-capable radio suggestions),
I'd like the xmit capability for emergency IFR use. It'll be
used only close to the terminal area, where the signal will
be strong enough to slope-detect on ATC receivers.
Yes, I know it's not type-accepted, but in an emergency,
I'm not going to care, and given the most likely emergency scenarios,
I'd rather spend the money on a battery-powered GPS than on a "real"
aircraft-band handheld. (I'd rather have guaranteed good navigation
and "iffy" communication than "probably-good" communication and
"iffy" navigation.)

Thanks,
-- Bruce Toback

>> voting on it. Someone else did see the need and was able to convince others
>> of its merits.

>Or you could vote NO if they were unable to convince you!

You're free to vote as you choose. The only argument here was when someone else said that an abstention was somehow equivalent to a yes. Several of us have brought up numbers to show that we believe that is not true.

Then again... in any vote or election, people often view any option that is not their choice as against them. I'm just trying to argue against changing the perceived definition of an abstention.

Abstaining on any given newsgroup means you do not cast a vote for or against it. That leaves the results to be determined by the people who did have an opinion on it. In order to pass, each separate proposed newsgroup must obtain at least a 2/3 majority and the yes votes have to outnumber the no votes by 100.

If you have an opinion on any given newsgroup, you SHOULD vote yes or no as appropriate. I encourage everyone to vote. In case you missed the CFV, I set up a mail-reply program after several people asked me for copies. Just send a message to cfv-request@uts.amdahl.com and it will send you a copy of the official CFV as posted by the moderator of news.announce.newgroups.

Well, as most everyone knows, it is sold as a 10 meter transceiver.
Yet, if you open it up and flip a couple DIP switches, you have a
26-32 MHz transceiver. Furthermore, you can LOCK the channels to
the 40 CB ones used. Overall, it's worth it's price, but extremely
large for a mobile. It does spaz out (if you try to push a button
(for the light dimmer) the channels will go up mysteriously. DO
NOT get the RCI-2970, many companies sell a kit to upgrade the 2950
to 100 watts (which is the RCI-2970) for about $120.
Also, many features reset themselves if you turn the set OFF then ON.
The scanning is slow, the memory presets are OK, yet the clarity is
awesome (I've had numerous people telling how nice it sounds). I'd
reccomend this to anyone with the money.

I would hope that the reason is to accomodate Civil Air Patrol (CAP) and
Military Affiliate Radio System (MARS) users. These services use
frequencies adjacent to the 2m band, both above and below. As a
long-time USAF MARS member, I would not buy a radio that was not
modifiable for MARS transmit.

I second the motion: My 2950 is wonderful. It has good audio output and fidelity. Very large and clear readout. The one problem I had was the backup battery is simply a lithium coin cell soldered to the logic PCB and it will die after about a year or two. I simplu replaced this battery with a 2-AAA battery holder from radio shack: pop rivited to the radio frame and used two AAA alkilines. The AAAs and plastic holder are cheaper than the lithium coin cell and make it easy to change memory backup batteries.

There is plenty of room inside and I have considered the posssibility of perhaps locating and installing a 2-meter transverter for satellite work.... haven't been able t locate a cheap source for the basic transverter though.

Source record: 281447

Eric KB6LUY suggested buying the 11-meter band. At first blush it's
a pleasant thought. However, what to do with the current occupants??
We seem to be having enough trouble keeping them off the 10-meter
band. Can you imagine what it would be like to run them off "their"
band??? It's one of those good ideas that is impractical (if not
impossible) to achieve.

I wonder how much longer it'll be before they put out a dual-bander and
a mobile. Obviously the're realizing that there's some money to be made
on amateur gear. Can you imagine an HF rig from Radio Shack? Kind of
scary really.

This is essentially correct, although this "50% of the time" assumption
is wrong. When receiving a circularly polarized antenna, one can use any
polarization and be assured of receiving a signal.

> More questions, how does using a circularly polarized antenna help.

FM broadcast stations transmit circularly polarized signals, usually.
Consider that most home FM receiving antennas (dipoles, loops, TV
antennas, etc.) are horizontally polarized, while almost all mobile
antennas are vertically polarized (and some are in between!) The only
mode of polarization that ensures good reception for all is circular.

(munch)

This is the same retrograde noise I've discredited
before, but it keeps rising from the dead, so here goes again.

The fundamental problem with this "emergency" operation justification is
that learning the code once upon a time has NO bearing on whether you can
operate code on the air. I am living proof that this argument is crap.

I learned morse code pretty well, or at least well enough to
trivially pass the Novice 5 wpm exam. I promptly garbage-collected
those neurons as best I could because I never intended to operate
morse on the air and never have. Do YOU remember all the
obscure characters from Greek Mythology you learned just to
pass your Classics courses in college? Maybe you do, but very
likely you don't. Why? BECAUSE YOU DON'T CARE.

I DON'T CARE ABOUT MORSE CODE. I learned it because it was
then required, but I promptly forgot it and never used it.

Unless you are lobbying for some Draconian, utterly unenforcable
rule like "must run CW once a week", this crap about "helping
in emergencies" is vacuous.

One important observation is that in the Loma Prieta earthquake
in Northern California, the mode of communication which did NOT
go down was the Internet! While the Hams were trying to get
organized to carry traffic, email was whizzing along just fine.
Why? Because the technology AUTOMATICALLY adjusted for the backbone
link outages. Yes, some sites were cut off, but it took at least
two major link failures to get them, but they were back as soon
as the router that lost power came back up.

So, if emergency communication is what you want, start learning
about packet and self-managing networks instead of humans trying
to play packet-switch sending messages via some odd on-off keying
scheme with lousy bandwidth efficiency.

Well, there. Now i've done it.

Brian, cover my rear while I duck under the rock.

2643. AMTOR with MFJ 1278

Newsgroup: rec.radio.amateur.misc
Date: 1993-05-16 13:17:07 UTC
From: grib@esvx12.es.dupont.com
Message-ID: <1993May16.131707.24097@es.dupont.com>
Source record: 281500

Hello All,
I have a MFJ 1278 where I am trying to get it working on AMTOR. I can copy some of the conversations with the "listen" command, but when I try to link up, the transmitter starts switching on and off, but I never have made the "link". The unit seems to work fine on RTTY, FAX, CW, and packet (both HF and VHF), so I'm not sure if it's the unit itself or if something I don't have set right. I have a SELCAL picked out and that's ready to use, so I'm a bit stumped.....
Other things.....what is the AGC setting that most people use on AMTOR? I have mine set at AGC slow, since the "fast" settings seem to interject a bit more noise than the slow setting....

Any help, or comments would be appreciated.

Thanks,

Joe KI3B

Archive-name: radio/rec-radio-info/welcome
Last-modified: $Date: 1993/05/03 10:36 $
Version: $Revision: 1.04 $

*** Welcome to rec.radio.info! ***

Welcome to rec.radio.info, a group that aims to provide a noise-free source
of information and news for the entire rec.radio hierarchy.

Two introductory articles about rec.radio.info are posted to the group and
to news.answers every two weeks. You are now reading the first article, which
explains what rec.radio.info is, and answers some Frequently Asked Questions.
The second article is titled "Submission Guidelines", and you only need to
read it if you want to submit an article to rec.radio.info.

You can skip to the next section of this article by searching for the next
" -- " string. The sections available are:
- What is the purpose of rec.radio.info?
- Why are messages almost always cross posted to rec.radio.info?
- What is a 'follow-up', and what does 'moderated' mean?
- OK, so now I know what 'moderated' means. Tell me more.
- What type of material is considered inappropriate?
- I do not have access to news, how can I get the information posted to
rec.radio.info?
- Will the material appearing in rec.radio.info be archived somewhere?
- I have a regular posting with timely information, is there a way to
speed up it's delivery, or automate for more convenience?

-- What is the purpose of rec.radio.info?

The purpose or charter of rec.radio.info is to provide the Usenet community with
a resource for information, news, and facts about any and all things radio.

All the other rec.radio groups are intended for discussions and general chit
chat about radio. Rec.radio.info will contain informational, factual articles
only. Follow-ups are redirected to an appropriate other group, and further
discussion (if any) will not take place in rec.radio.info.

In order to ensure that rec.radio.info contains only appropriate articles, it
was decided to create the group as a moderated newsgroup.

-- Why are messages almost always cross posted to rec.radio.info?

It provides a "tag" for each article to be assembled into a filtered
presentation in rec.radio.info (even with cross-posting, only one message, with
```

a unique Message-ID, is propogated across the net). This tag also facilitates a pre-existing method of dropping or cancelling the articles locally within the discussion groups if you don't want to see them. This accommodates individuals who want to separate the bulletins from the discussions, discussions from the bulletins, as well as those who are adamant about not reading another newsgroup and wanted to see everything all in one basket.

With the total size of Usenet (in number of newsgroups and total traffic) doubling every year or so, this is no insignificant contribution to reducing information noise and chaos. Making the discussion groups a catch-all, and making extra newsgroups filters on that catch-all, is also the most realistic way to implement such a scheme (It's not intuitively obvious what the charter, contents, and general appropriate topics for each and every newsgroup are. Seeing FAQ's and charter/intro postings in the home newsgroup is beneficial for new readers).

By cross-posting one only is adding a few tens of bytes to each bulletin (to specify the extra group on the Newsgroups line), but are adding the capability for very powerful filtering features available on most news servers, listservers and readers. Your local news guru could probably explain these features in more detail.

In rn, for example, according to Leanne Phillips in her rn kill-file FAQ, add a line of the form:
/Newsgroups:.*[,]rec\.radio\.info/h:j
either in ~/News/KILL (if you don't want to see rec.radio.info articles anywhere) or ~/News/rec/radio/amateur/misc/KILL (if you don't want to see them just in rec.radio.amateur.misc). The latter method means your kill file will only be consulted during rec.radio.amateur.misc (and hence runs more efficiently), and will probably work for most people.

In nn, according to Bill Wohler in his nn FAQ, add a line of the form:
rec.radio.info:!s/:^
in ~/.nn/kill (if you don't want to see rec.radio.info articles anywhere), or put the following lines:
sequence
rec.radio.info
rec.radio.
at the end of ~/.nn/init in order to see all the rec.radio.info bulletins first, then read the remaining rec.radio.* without the bulletins.

-- What is a 'follow-up', and what does 'moderated' mean?

If you are new to Usenet and are not familiar with the terminology, you might want to read the general introductory articles found in the newsgroup news.announce.newusers. Doing so will make your life on the net much easier, and will probably save you from making silly beginner's mistakes.

If you think that at this moment you are reading an echo, a conference, or a bulletin board, I'd also strongly suggest a trip over to news.announce.newusers.

For the rest of this article, I will assume you have a basic knowledge of Usenet terminology and mechanics.

A moderated group means that any article that needs to be posted to the group has to be accepted by the moderator of the group. Since we need to ensure that followups to an article (discussion) do not show up in the rec.radio.info newsgroup, the `Followup-To:' header line contains a newsgroup that is appropriate for disussions about the specific article.

-- OK, so now I know what 'moderated' means. Tell me more.

Rec.radio.info is a moderated newsgroup, which means that all articles submitted to the group will have to be approved by the moderator first.

The current moderator of the group is Mark Salyzyn. Submissions to rec.radio.info can be posted, or e-mailed to:

rec-radio-info@ve6mgs.ampr.ab.ca

Comments, criticisms, suggestions or questions about the group can be e-mailed to:
rec-radio-request@ve6mgs.ampr.ab.ca

But before you do so, please be sure to check out the "Submission Guidelines" article.

The influence of the moderator should be minimal and of an administrative nature, consisting chiefly of weeding out obviously inappropriate articles, while making sure correct headers etc. are used for the appropriate ones.

-- What type of material is considered inappropriate?

There are three broad categories of articles which will be rejected by the moderator:

1) Requests for information: rec.radio.info is strictly a one-way street. I receive information in my mailbox; I then post it to rec.radio.info. Requests for specific information belong in the normal discussion newsgroups. If your request gets answered, you might consider passing the answer on to rec.radio.info, though. Especially if you can edit it into a informational, rather than a discussion, format.

2) Obvious discussion articles, or articles that appear unsubstantiated.

3) Commercial stuff: a relatively unbiased test of a radio product would be accepted, but any hint of for-profit might be reason for rejection. For three reasons: This is not the purpose of the list, for-profit is a controversial topic, and this list may be passed onto Amateur Packet Radio (where for-profit is prohibited except under certain provisos).

rec.radio.swap may be more deserving of the posting in any matter.

Similarly, copyrighted material generally cannot be used. If it's TRULY worthwhile to the net, I would recommend obtaining permission from the copyright holder. Please note the source, and if permission was given. I reserve the right to make the final decision concerning appropriateness in

all situations. In most cases, a brief summary of, or pointer to, the copyrighted information may be all I can allow.

-- I do not have access to news, how can I get the information posted to rec.radio.info?

brian@UCSD.EDU (Brian Kantor) has kindly supplied a mail list server for rec.radio.info. Non of the articles will be digested, due to their size, so you will receive individual mailings for every article posted to the group.

Mail sent to radio-info@ucsd.edu will be forwarded to the moderator and thus is an alias to rec-radio-info@ve6mgs.ampr.ab.ca

To subscribe and unsubscribe via the listserver; the format for that is

sub address radio-info
unsub address radio-info

where 'address' is your full mailing address. Send this request to

listserv@ucsd.edu

Note that the server will automatically delete any address that bounces mail. If you leave the address portion blank, it will try to deduce your address from the mail headers. This may not work if you are on bitnet, milnet or some other non-Unix host, so it is recommended to put your return address in any case. For example:

sub mymailbox@myhost.mydomain.mil radio-info
or
sub MEMEME01@DMBHST.bitnet radio-info

or something like that.

-- Will the material appearing in rec.radio.info be archived somewhere?

Yes. Still firming up details at the moment but here is a preliminary list:
- unbc.edu as maintained by Lyndon Nerenberg <lyndon@unbc.edu>
- nic.funet.fi maintained by Risto Kotalampi <rko@cs.tut.fi>
saved to /pub/dx/text/rec.radio.info currently stored as numbered files.

Effectively this means that anything you post to rec.radio.info will be permanently stored, so your work will not be lost.

-- I have a regular posting with timely information, is there a way to speed up it's delivery, or automate for more convenience?

Yes, there is! It may take a bit of chatter with the moderator, but we are willing to take responsible people and provide them the means of posting the articles directly from their site. We will try everything we can as we fully realize that DX (distant signal) and astronomical data can be somewhat transitory. We are also willing to allow regular posters of information the same courtesy, even if the information is not as time critical.

We refer to this as self-moderation, which is partly based on the model for news.answer. This requires co-operation and good will to be beneficial to the community in the rec.radio hierarchy.

I suggest reading the posting guidelines for more information. I am open to suggestions.

I thank the following individuals for their input into this article:
rec.music.info moderator Leo Breebaart rec-music-info@cp.tn.tudelft.nl
rec.radio.broadcasting moderator Bill Pfeiffer wdp@gagme.chi.il.us
Paul W. Schleck, KD3FU pschleck@unomaha.edu
Ian Kluft, KD6EUI ikluft@uts.amdahl.com

Actually, Mike, you forgot to mention the other communications technology that kept working in the Loma Prieta earthquake: telephones. Between the internet and the public phone system (including cellular phones), it was pretty clear that hams had little to offer the emergency services people.

Yes, hams do well in the health-and-welfare messaging arena, providing loved ones with some reassurance that their relatives are still kicking, but the days when ham radio was the only communications for emergencies are long over. Where hams help these days are in the days AFTER the emergency. And that's a noble thing. But it rarely is critical to life and safety.

It seems to me that the "in case of emergency" arguement in favor of Morse code is self-defeating: as the number of hams physically capable of responding in an emergency decreases - remember, the age of the ham population [before no-code] was steadily increasing, with more than half of it over 50 - the likelihood of there being a ham on-scene with any ability to make use of his Morse knowledge was steadily declining. To take it to an extreme, it might well have gotten to the point where the only place Morse could be of use in an emergency is in rest homes.

Morse code has an honored place in our hobby. But as a licensing requirement, its time has passed.
- Brian

2646. RACES Bulletin #274

Newsgroup: rec.radio.amateur.misc
Date: 1993-05-16 17:55:34 UTC

Message-ID: <9305161755.AB11767@ucsd.edu>
Source record: 281281

Bid : $RACESBUL.274

TO: ALL EMERGENCY MANAGEMENT AGENCIES VIA AMATEUR RADIO
INFO: ALL RACES OPERATORS IN CA (ALLCA: OFFICIAL)
ALL AMATEURS U.S. (@ USA: INFORMATION)
FROM: CA STATE OFFICE OF EMERGENCY SERVICES (W6HIR @ WA6NWE.CA)
2800 Meadowview Rd., Sacramento, CA 95832 (916)262-1600
Landline BBS open to all: (916) 262-1657
RACESBUL.274 DATE: May 17, 1993
SUBJECT: MGT - The committed volunteer - Part 3/3
Other people may serve only when they are needed to perform
INFREQUENT and usually unscheduled tasks. A few examples include
extra operators for a major incident, installation or maintenance
activity, computer programmers, special projects, etc. I use as
an example one volunteer we have who is a computer communications
program expert. If a terminal hangs up we may need his advice
fast. One phone call and the problem is usually cleared in
minutes. His advice is invaluable and priceless. He does not come
in to the office and serve. He may respond into the field on an
incident perhaps once a year. But you can see how it's impossible
to put a price tag on his value to us without his having to meet
radio nets or serve some expected hours per month.
You and, more importantly, your Radio Officer will know the
capabilities and talents of each volunteer. It's your Radio
Officer's responsibility to recruit enough people with the likes
and skills to provide depth and redundancy.
As your Radio Officer's supervisor it is your role to
motivate, lead and inspire. Let your volunteers be the best they
can be --- and they will!

Tom, K7ITM wrote regarding the inadequacies of the current ARRL repeater directory. I believe this may have been a topic of discussion some time ago, but would like to agree with his comments about the geographical designations. I bought a new directory in '92 to replace a five year old guide. I was amazed to find cities I am familiar with placed in impossible areas of their states, and repeaters in or adjacent to a known city listed under seemingly odd locators. I realize that a national directory is a large undertaking, but we ARRL members and the purchasers of the guide are paying for the staff who puts out this product. I,too, have begun compiling my own lists as I travel, and organize the information in a manner useful to me. The book format of the ARRL guide does not let me rip out the repeater and packet info I really have no use for on my trips. Next trip I plan to ditch the ARRL book, use my customized guide and perhaps try some of the new map cards now available. When the ARRL book again becomes actually useful, they may get me back!

One can buy 2 meter mobiles for a little more than $300. I picked up a Yaesu FT-2400 for about $325 and by the time I got the accessories to put it in the car, the total was about $450. I ran a HT for about a year in my car, and now that I have a mobile, will never do that again. No more holding the HT by your ear so you can hear it. Even with a $200 HT, by the time you buy an external antenna, amp and speaker mike, the cost comes out within about $50. I would definately recommend a mobile versus an HT.
I have not had any problems with the front end on my 2400 but I have not been downtown with it yet either. Even

copied from packet:
Path: N6IIU!N6QMY!N6IYA!WA7SJN!WA7BHH!W7GCI!W7GCI!W0RA ...

Here is the expanded TX mod for the Alinco DR-130:
1. Open the top of the case by removing the three screws.
2. Locate the blue loop of wire near the display, facing toward you.
3. cut the blue loop of wire, and tape up the ends.
4. replace cover of the radio.
5. reset the radio by holding the function key down and turning on the power.

Here is also a cute little mod for the display:

Insted of seeing frequency display (147.585 etc.) You can have it read out like a business band radio (CH-1) by holding the VFO/M/W key and turning on the power.

ARSENE LAUNCH A SUCCESS

HR AMSAT NEWS SERVICE BULLETIN 135.01 FROM AMSAT HQ
SILVER SPRING, MD MAY 15, 1993
TO ALL RADIO AMATEURS BT
BID: $ANS-135.01

ARSENE Successfully Launched 12-MAY-93 At 00:56 UTC

After a nominal launch from the Kourou, French Guiana spaceport on 12-MAY-1993 at 00:56 UTC, a new satellite has joined a proud family of satellites serving the amateur radio community. After some initial dificulties in establishing command of ARSENE after launch, a Paris ground command station did successfully command the Mode-S transmitter on late Thursday, 13-MAY-93, and started the flow of spacecraft telemetry from ARSENE. The capture of this telemetry is a very important step inorder to ensure that all of ARSENE's subsystems are performing nominally in preparation for the firing of the ARSENE rocket motor. Once the telemetry has been analyzed, ground controllers will issue the command for ARSENE to fire its "apogee-kick-motor" inorder to raise its dangerously low perigee to a considerably higher and safer altitude. The current "geostationary transfer orbit" is about 205 KM by 36,000 KM in altitude. After the first motor firing, ground controllers will study ARSENE's telemetry and then later fire the motor for a second time to achieve an orbit of 20,000 KM by 36,000 KM.

At the time that this AMSAT News Service (ANS) bulletin was written, there was no further news of the status of the ARSENE motor firing. Please stay tuned to the various AMSAT HF and VHF nets for more information about ARSENE in the upcoming week.

[The AMSAT News Service (ANS) would like to thank G0SUL (formerly G0/K8KA) of the University of Surrey and LW2DTZ of AMSAT-Argentina for the inform-ation which went into this bulletin item.]

SB SAT @ AMSAT $ANS-135.02
SAREX SUMMARY: PART I

HR AMSAT NEWS SERVICE BULLETIN 135.02 FROM AMSAT HQ
SILVER SPRING, MD MAY 15, 1993
TO ALL RADIO AMATEURS BT
BID: $ANS-135.03

KA3HDO Discusses The Issue Of SAREX General QSO Ops On STS-55 and STS-56

The SAREX Working Group has received several inquiries regarding the low number of general QSO contacts made during the STS-56 and the STS-55 SAREX missions. Because of these concerns, I felt it necessary to respond to this issue so that you are not left in the dark.

The Working Group, consisting of the ARRL, AMSAT, and the JSC ARC, was initially caught by surprise at the low number of general QSO contacts during these missions. We understand your concerns; however, it is very important that we all put the activities of these past two SAREX missions into perspective.

Please remember that SAREX is a SECONDARY payload. During both these missions, the shuttle crews were working various payload issues. For example, the shuttle crew on STS-56 was very busy working primary payload issues; particularly a high data-rate communications problem between the shuttle and the TDRSS and an Electro-Magnetic Interference (EMI) problem on the flight deck. Moreover, power conservation was a main concern on STS-55 in an effort to extend the mission for the PRIMARY payload. Remember that when a problem or issue arises, SAREX will get a "back seat".
I have stated before that "The primary goal of SAREX is to spark student's interest in the science, technology, and communications fields by allowing them to talk to Space Shuttle astronauts using amateur radio." (See article entitled "SAREX Hardware Configurations and Flight Operations Support" in the September/October 1992 issue of the AMSAT Journal). Remember, our prime sponsor of this activity is NASA's Office of Education. Moreover, I wrote in the article "As time permits, members of the SAREX flight crew will make random QSO contacts with hams on the ground." We cannot and should not guarantee a large quantity of random QSOs with the crew on any specific Shuttle mission. This is asking too much from the SAREX Working Group and NASA.

As I stated in the above mentioned article, SAREX is a multifaceted program which includes student education (prime goal), ham radio DXing, technical experimentation and crew-family contacts. You are aware from your own experiences that as you do more, you tend to focus less on one specific activity. As such, when SAREX flys all the operating modes (Voice, packet, SSTV and ATV-uplink) -- as was the case on STS-56 -- there is less time to do one specific mode. Please keep this mind in the future.

Packet radio operations are primarily performed when the Shuttle crew is busy with the primary or other secondary payloads. Because of the EMI issues on the flight deck and also the operations of other SAREX modes (school groups, ATV, etc.), the packet robot was only on 10-15% during the STS-56 mission. In addition , the critical power conservation measures on STS-55 resulted in the shutdown of the SAREX robot for more than half of this mission. Once we were given permission to turn on the packet robot, the SAREX antenna connector failed. Within 36 hours, the SAREX team requested and got permission from NASA to move the packet system into the German spacelab module and use the SAFEX shuttle bay-mounted antenna. This was quite a feat because we had to prove to NASA that flight safety would not be compromised if the system was left in the spacelab module during a real emergency. (Remember, during landing, the Shuttle flies like a glider

and weight and balance is critical to ensure flight safety). Although the packet robot was on for a small percentage of these missions, over 300 international packet QSOs were accumulated on each mission.

SB SAT @ AMSAT $ANS-135.03
SAREX SUMMARY: PART II

HR AMSAT NEWS SERVICE BULLETIN 135.03 FROM AMSAT HQ
SILVER SPRING, MD MAY 15, 1993
TO ALL RADIO AMATEURS BT
BID: $ANS-135.03

KA3HDO Discusses The Issue Of SAREX General QSO Ops On STS-55 and STS-56

From a mutifaceted standpoint, the STS-56 and STS-55 SAREX flights were a resounding success. The SAREX Working Group is quite proud of the accomplishments of the crew and the SAREX support team for all their efforts. In particular, we had an improvement in the success rate of the school groups on these missions as compared to past missions. All the schools had good station setups and all but a small few made outstanding horizon-to-horizon contacts on their first attempt. This success rate was largely the result of the AMSAT technical support team that was developed to improve the school success rate. STS-56 Commander Ken Cameron surprised the Cap Com in Houston when he reported that he could see them from the Orbiter (via the ATV uplink). In addition, the first confirmed ship-to-ship contact between the Space Shuttle and MIR occurred on STS-56 on April 10, 1993 at a Mission Elapse Time (MET) of 2 days, 17 hours and 32 minutes. Mike Foale, KB5UAC, was the Space Shuttle crew member at the microphone to accomplish this historic first. This was followed up by a 1 minute 45 second conversation with the MIR crew from the Space Shuttle Columbia on STS-55 using the externally mounted SAFEX antenna. On STS-55, hams and students in the southeastern U.S. participated in a highly successful A/B antenna test using the SAREX window mounted antenna for one orbit and the externally mounted SAFEX 2M antenna on the next orbit.

The SAREX Working Group has discussed the need to provide very limited scheduled opportunities for general QSO operations in addition to any random times the crew can afford to operate. One or two opportunities per mission would allow hams and nonscheduled school groups to hear and potentially work the Shuttle astronauts on a pre-defined schedule. We will carefully consider this option in the months ahead. Please note, however, that the earliest that this could be accommodated is on the STS-58 mission this summer. We will keep you posted.

Effective and reliable communications is always important in this hobby. I hope the above bridges that gap and helps you better understand the activities that transpired on these two missions and the priorities of the Space Shuttle and SAREX missions. If you have any further questions or comments, please direct them to me at ka3hdo@amsat.org or via my callbook address. I will try to respond to you as best I can. On behalf of the SAREX Working Group, we invite you to continue your pursuit of the ultimate

DX contact -- that with a crew member on the Space Shuttle!

73,

Frank H. Bauer, KA3HDO

SB SAT @ AMSAT $ANS-135.04
AMSAT OPS NET SCHEDULE

HR AMSAT NEWS SERVICE BULLETIN 135.04 FROM AMSAT HQ
SILVER SPRING, MD MAY 15, 1993
TO ALL RADIO AMATEURS BT
BID: $ANS-135.04

AMSAT Operations Net Schedule

AMSAT Operations Nets are planned for the following times. Mode B Nets are conducted on AO-13 on a downlink frequency of 145.950 MHz and Mode J/L on a downlink of 435.970 MHz.

Date UTC Mode Phs NCS Alt NCS

23-May-93 0030 B 156 VE2LVC W9ODI
30-May-93 0000 B 62 N7NQM W5IU

Any stations with information on current events would be most welcome. Also, those interested in discussing technical issues or who have questions about any particular aspect of OSCAR statellite operations are encouraged to join the OPS Nets. In the unlikely event that either the Net Control Station (NCS) or the alternate do not call on frequency, any participant is invited to act as the NCS.

****

Slow Scan Television on AO-13

SSTV sessions will be held on Saturdays and Sundays UTC:

Mode J Downlink 435.980 MHz
Mode B after J Downlink 145.960 MHz

OPS NETS will take priority, look for SSTV activity immediately after the net. SSTVer's are invited to join the Net to make schedules at other times if desired.

/EX
SB SAT @ AMSAT $ANS-135.05
WEEKLY OSCAR STATUS REPORTS

HR AMSAT NEWS SERVICE BULLETIN 135.05 FROM AMSAT HQ
SILVER SPRING, MD MAY 15, 1993
TO ALL RADIO AMATEURS BT
BID: $ANS-135.05

Weekly OSCAR Status Reports: 15-MAY-93

AO-13: ATTITUDE CHANGE
L QST *** AO-13 TRANSPONDER SCHEDULE *** 1993 May 10 - May 31
Mode-B : MA 0 to MA 130 ! Omnis MA 250 - MA 60
Mode-BS : MA 130 to MA 180 !<- S transponder; B trsp. is ON
Mode-S : MA 180 to MA 190 !<- S transponder; B trsp. is OFF
Mode-LS : MA 190 to MA 195 !<- S beacon + L transponder
Mode-JL : MA 195 to MA 210 ! Blon/Blat 210/0
Mode-B : MA 210 to MA 256 ! Move to attitude 120/0, May 31

Please don't uplink to Mode-B during MA 180-190. Doing so will interfere with Mode-S operations. Mode-S will be ON for nearly 3 hours, from MA 130 to MA 195. New Mode-S stations appear daily. During MA 130-180, Mode-S stations will have to endure the coupling from Mode-B users operating between the downlink passband between 145.880 - 145.920 MHz. Either work between them, use them as test signals or go X-band. From MA 180-190 is Mode-S transponder exclusive (plus Mode-B beacon). MA 190-195 is Mode S beacon (plus Mode-L transponder). [G3RUH/VK5AGR/DB2OS]

FO-20: The FO-20 Ground Control Station, JJ1ZUT, announced that FO-20's operational schedule during the month of May will be as follows:

Analog Mode Operation(in UTC):
May 19 10:20 <---> May 20 10:40
May 26 10:50 <---> May 27 11:08
At all other times, expect the digital mode and BBS to be in operation. [JJ1WTK/3]

AO-16: Operating normally and has a number of interesting educational files regarding the WO-18 spectrometer experiment. [WH6I]

LO-19: Operating normally. [WH6I]

UO-22: Operating normally. [WH6I]

KO-23: The KITSAT-OSCAR-23 Bulletin Board System (BBS) has been up-and-down lately. The RAM disk was wiped out and old files were lost. However, recently, the BBS has been up for a few days now and so files are accumulating again. There is a pair of new earth images available for downloading. There have been some questions about the operation of KO-23's receivers, and opinions differ. If you find that one receiver doesn't work, then try the other one. This may have been a software problem, since it seems to have resolved with software re-start. [WH6I]

W0-18: WO-18 is still getting great pictures from the on-board camera. The spectrometer software has also been uploaded at last. The spectrometer seems to be working well, and either it or the camera can now be selected on command. Software for decoding & analysis of the spectrometer data has reportedly been uploaded onto AO-16 and LO-19. Work is progressing on the improvements and updates to WeberWare. New code for the spacecraft which will allow doubling of video fields is also under consideration. If com-pleted, this would improve the quality of the photos, although it will take longer to collect 100% of the data. [WD8QCN]

RS-10: RK3KPK, the Ground Controller for all of the RS satellites and operator RS3A reports an incredible flurry of DX activity on the RS birds during the past 10 days. RK3KPK reports that he has heard stations from the US, Russia, Europe, Australia, Brazil, and South Africa on the RS birds. RK3KPK uses a 100 watt RF output transmiter into a ground-plane antenna and a 3 element Yagi antenna inorder to receive signals from RS-10. He invites all to use RS-10's special channel with its uplink frequency of 145.850 MHz and a downlink frequency of 29.350 MHz. In a final note from RK3KPK, he also reports that RS-15 will be launched later this year. He added that RS-15 is currently in Moscow and is ready for launch. [RK3KPK @ RK3KP.#MSK.RUS.EU]

MIR: VE3BRO reported that heard one of the cosmonauts calling stations in the US on 16-MAY-1993 on a pass that began at his QTH around 18:42 UTC. The downlink frequency was 145.550 MHz FM. [VE3BRO]

The AMSAT NEWS Service (ANS) is looking for volunteers to contribute weekly OSCAR status reports. If you have a favorite OSCAR which you work on a regular basis and would like to contribute to this bulletin, please send your observations to WD0HHU at his CompuServe address of 70524,2272, on INTERNET at wd0hhu@amsat.org, or to his local packet BBS in the Denver, CO area, WD0HHU @ W0LJF.#NECO.CO.USA.NOAM. Also, if you find that the current set of orbital elements are not generating the correct AOS/LOS times at your QTH, PLEASE INCLUDE THAT INFORMATION AS WELL. The information you provide will be of value to all OSCAR enthusiasts.

Source record: 281294

Scott -

By the time you read this, Armed Forces Day and
the Crossband Test will be history. It was written up in
the May QST on page 128 and I posted it on this forum
about four weeks ago (as well as packet and a few other
places that I could think of).

It happens every year on Armed Forces day, the third Saturday of
May. The military MARS stations from the Air Force, Army, Navy-Marines
and Coast Guard operate on their frequencies and listen
in the ham bands. They work SSB, CW, Packet and RTTY, usually telling
where they are listening. Sometimes the operators are the MARS
operators due to the lack of ham volunteers; they do the best they
can since they dont (normally) hold ham tickets or know about that
aspect of communications (someone said "appliance operator").

I worked at AIR this year (AF Mars at Andrews AFB DC) and
worked the 20 SSB meter position (14408/14292+ or minus). It's
a lot of fun as well as proves the interoperability aspects of
this type of operation.

Maybe next year we can get you involved.

jd

[820]
RF EFFECTS DOCKET ISSUED

The FCC has released a Notice of Proposed Rule Making to update the guidelines and methods used for evaluating the environmental effects of radio frequency radiation. This, based on new RF exposure standards adopted in 1992 by the American National Standards Institute, in conjunction with the Institute of Electronic and Electrical Engineers.
Back in 1985 the FCC adopted 1982 its original set of ANSI guidelines. These resulted in some transmitting facilities being required to prepare an Environmental Assessment if they would expose humans to RF levels greater than those recommended. Under the 1985 guidelines many low-power, intermittent, or normally inaccessible RF facilities were excluded from the FCC's rules, including Amateur Radio stations.
The new, 1992 ANSI guidelines are more restrictive in the amount of RF exposure permitted. They also extend the frequency range under consideration from 3 kHz to 300 GHz. And, they specify two sets of exposure recommendations. One is for controlled environments involving workers and another for uncontrolled environments involving the general public.
Also, and very important to most hams is that hand-held devices such as portable cellular phone, handie-talkies and the like are for the first time covered. The 1982 guidelines included exclusions for devices that did not exceed a specific absorption rate or whose input was 7 watts or less. The 1992 guidelines also contain low-power exclusions, but they are more stringent.
The comment date in docket ET 93-62, is August 13, 1993. Reply comment are due no later September 13, 1993. This is a docket all hams will want to keep their eyes on.

*****
902 MHz AVM PROPOSAL RELEASED

The FCC has also issued its long expected Notice of Proposed Rule Making to allow the expansion of automotive vehicle monitoring systems through the creation of a new location and monitoring or LMS service in the 902-928 MHz band. This one seems to hold bad news for ham radio in that we could loose access to the band.
The NPRM, called Private Radio Docket 93-61 would make more users eligible for LMS services as well as making private carriers eligible for licenses. The FCC says that it expects this expansion could lead to rapid congestion of available spectrum. Amateur Radio currently share this band with

government radiolocation, fixed, and mobile services. The FCC notes that interference from all of these services, including amateur, to the expanded LMS systems is possible.
As a result, the commission is asking for comments from potential LMS users on whether they believe it possible to establish reliable LMS systems in this spectrum considering the number and diversity of other users of this band. If not - and this is the kicker - the FCC wants commenters to offer potential solutions, such as removing Part 15 users and amateur operations from the band, restricting where such users could operate in the band, or placing stricter limitations on the operations in this band.
This is one that we will all want to voice our opinion on. The comment date is June 29 with Reply Comments due no later than July 14th. We suggest you get over to your word processors and make your feelings on this one known.

*****
CBS STAYS ON

Talking about staying on the air. This story is for everyone except our listeners in the New York City metropolitan area. You already know it. You lived through it. But now let us share it with everyone else. It is about planning ahead.
When a terrorists car bomb exploded in the basement garage of the World Trade Center WCBS television was that city's only VHF station staying on the air. According to Broadcast Engineering magazine, CBS has the forethought to keep its back up transmitter at its old transmitter site atop the Empire State Building further up town.
As soon as the blast occurred, both WNBC and Public Broadcasting Station WNET fell silent. The remaining stations went down about an hour later when all power was cut to the World Trade Center complex. No emergency generators were available because they were in a sub-basement that was flooded by a broken water main.
So it was WCBS, using the equipment at the Empire State Building -- the same equipment that had at one time been its primary transmitter that brought information to a news hungry public for almost ten hours. It took that long for the other stations located single site at the World Trade Center to get power and get back on the air.

****

[821]
CEL-TEL SCANNER BAN INSTITUTED

The FCC has banned the importation and sale of radio scanners capable of receiving cellular telephone transmissions effective April 26th. The new regulations change Parts 2 and 15 of the commissions Rules to prohibit the manufacture or importation of

radio scanners capable of receiving frequencies allocated to the Domestic Public Cellular Radio Telecommunications Service. This is presently 824 to 849 and 869 to 984 MHz.
While the FCC denied an ARRL request for specific wording that bona fide amateur equipment be exempted from the new rules, the Commission did agree to modify its proposed rule on converters. This, so that it applies only to converters designed or marketed for use with scanning receivers.
In denying the League's request the FCC said the rule modification would not adequately ensure that such converters would not be readily available and commonly used to intercept cellular communications. But the Commission did say that it did not believe it appropriate to restrict cable television converters or other devices that might be able to receive cellular telephone transmissions but were not designed for that purpose.
The FCC's new rules, in addition to the anticipated banning of scanners capable of tuning cellular telephone frequencies also prohibit frequency converters that either convert or are easily modified to convert cellular frequencies to other frequencies outside the cellular band that are easily received by most scanners.

*****
SCANNER BAN

In Newton Kansas, located thirty miles north of Wichita has enacted a very tough new anti-scanner radio statute that has radio amateurs in that town up in arms. Some amateurs who have long supported local emergency communications efforts are telling Newton officials to look elsewhere for assistance as a by-product of the new law that is all-encompassing and has no exemption for radio amateurs who's VHF and UHF ham gear has the ability to tune in on the banned frequencies.
The city fathers of Newton; a town of about 25,000 enacted the new law that forbids anyone to use a scanner radio in any location and makes it a crime to listen in on police, fire, sheriff or emergency response ambulance calls. The statute is a result of a dispute between two families one evening, and their friends who were listening in on a scanner radio decided to show up at the scene. The police department was upset at this, and with absolutely no notification to anyone, the Newton city leaders wrote it, adopted it, published it and it became law.
While city officials have assured concerned radio amateurs that they are in no way the target of the new statute, the hams do not seem to be willing to accept the law as written. They want a specific exemption for licensed Amateur Radio operators and members of the Newton Amateur Radio Club lead by its president Mike Bungart, WA0SXR, are working in that direction.
"...and they have assured us verbally that none of this was

intended toward Amateur Radio operators. They say that as long people do not interfere with police business they are not going to be bothered by the law. But we are working on trying to get it re-worded but those kind of things take time," Bungart said. Penalties under the law include a fine of up to $500 and imprisonment.

*****
NOVICE/TECH 30 METER PETITION DENIED

Still with regulatory matters, the FCC has denied a petition to grant Novice and Morse code certified Technician class licensees access to the amateur 30 meter band. The petition by famed ham radio instructor Bill Welsh W6DDB had asked that these license holders be allowed CW operation from 10.1 to 10.15 MHz. Welsh argued that the 40, 15, and 10 meter bands currently occupied by Novices and Technicians are becoming less useful due to changing sunspot conditions and interference from shortwave broadcast stations. He also said that the longer antennas needed for operation on 80 meters limited the appeal of that band for Novices and Technicians.
The FCC said that in opening the 30 meter band to the Amateur Service in 1985 it had not included Novices and Technicians in order to promote an acceptable balance between licensing incentives and operating privileges. Also, that it followed the same guideline in the opening of the 17 meter band in 1989. As such, the FCC said that the Welsh petition for rule making was repetitive and was being denied.

*****
FCC Clarifies Position on "Willful" Violations

Back in Washington, the FCC has clarified its position in regard to the term willful in regard to regulatory violations in all radio services. It did so when it refused to rescind a series of forfeiture penalties it had previously issued against a California based electronics manufacturer.
The FCC had assessed the company a total of $10,000 for a variety of infractions concerning sale of unauthorized alarm equipment ad mis-labeling had been established. While the company admitted that most of the infractions had occurred, it filed a Petition for Reconsideration of the monetary forfeiture penalties. This, on the grounds that the violations were not the willful result of a company policy to violate the rules. The company said that the violations were the result of inadvertent and clearly unintentional breakdowns in its quality control procedures, traceable to a single manager.
But the FCC responded that, under the Communications Act of 1934, that a "willful act" is defined as the conscious and deliberate commission or omission, regardless of any intent to violate any provision of the Act. They said that previous court

decisions have affirmed this language, saying, that willfulness exists if there is a voluntary act. It is not necessary to show that a person knew he was acting wrongfully.
In applying these guidelines, the Commission stated that the company deliberately marketed equipment in violation of FCC rules, regardless of whether it was aware of those violations. It said that nobody can claim an exemption from the rules on the grounds it did not know what its employees were doing, or on the grounds that it did not know it was committing a violation.

*****
OREGON JOINS MACC

The Big MACC has eaten yet another state and nobody is complaining. This Big MACC happens to be the giant Mid America Coordination Council and it was announced at the Dayton Hamvention that Oregon has joined the growing number of west-coast states to allies itself under the MACC umbrella. The group now represents the overall coordination interests of nineteen states ranging from Ohio on the east to the Western Washington and now Oregon on the west. This makes MACC the most powerful entity to be found in the arena of frequency coordination nationwide.
In addition to Oregon, MACC's sphere of influence includes the states Arkansas, Colorado, Illinois, Indiana, Iowa, Kansas, the upper peninsula of Michigan, Minnesota, Missouri, Montana, North Dakota, Nebraska, Ohio, Oklahoma, South Dakota, Western Washington, Wisconsin and Wyoming. Obviously, the Big MACC must be doing something very right.

*****
COLLOQUIUM

From England comes word that AMSAT UK will host its 8th Annual Satellite Colloquium from July 29th through August 1st. Authors wishing to present papers should submit an abstract to be considered for inclusion in this year's proceedings. Submissions should be sent to Doug Loughmiller G0SYX at the Centre for Satellite Engineering Research, the University of Surrey, Guildford, Surrey GU25XH England. Papers accepted for this year's proceedings will be required in final camera ready copy or on disk no later than June 15th.

*****
DX

In DX, word that members of the RAK Radio Society in Lebanon are now standing by on a daily basis to make contacts world-wide. If you are in need of a contact and a QSL card listen on 14.308 MHz upper sideband between 1900 and 1930 UTC for various OD5 prefix calls. We are told that all QSL's must go via the bureau unless otherwise directed over the air.

*****
YHOTY

A reminder from the Westlink Report newsletter. It says that its 1993 Young Ham of the Year Award will be presented at the Huntsville Hamfest and ARRL National Convention in Huntsville Alabama the weekend of August 14th and 15th.
The Westlink Report Young Ham of the Year is a person who in the view of the judges best epitomizes the accomplishments of youth in amateur radio. Achievements can be in any area of endeavour associated to the hobby service. To qualify, a nominee must be 18 years of age or younger, be attending an accredited school or place of learning and must hold any class of valid United States amateur license. Cutoff date for nominations is June 30th. For a nominating form please send an S.A.S.E. to the 1993 Westlink Report Young Ham of the Year, 28197 Robin Avenue, Saugus CA 91350.

*****
RICH YARIJIAN OBIT

We end this week on a sad note with word that former Newsline reporter Rich Yarigian, N6PVP, has died. Yarigian was thrust into the ham radio media spotlight in 1990 when he was assigned by Newsline to cover the second trial of former ham Richard Burton the ex-WB6JAC. Burton was again facing prosecution on a charge of operating the ham bands without a license.
At that time, Rich was one of the few hams trusted by both sides in the controversy. This made it possible for him to give our listeners a rather interesting insight into Burton, the thrust of the charges, and Burtons relationship with ham radio.
On Saturday, April 24th, Rich Yarigian N6PVP passed away after a long bout with Cancer. Services were held on Tuesday, April 27 in Palos Verdes, California. Sadly, Rich Yarijian was only 30 years of age.

*****

[822]
NOVICE VE TESTS

The FCC has placed Novice class examinations under the Volunteer Examiner Coordinator program and will allow recovery of out-of-pocket costs for coordinating and administering the tests.
In announcing its decision on Thursday May 7th, the FCC said that placing Novice examinations under the VEC system would avoid confusion caused by having two different systems. This will result in fewer errors in exam administration and in paperwork, will allow simplification of the FCC Form 610 application and improve the availability of overall data on examinations.
As with other class amateur license exams, responsibility for both preparation and administration of Novice exams will lie with the VEC testing system. Actually, the examination elements

required for the Novice license are already being administered in the VEC system because they are also requirements for other classes of amateur operator licenses. No implementation date for folding all Novice tests under the VEC system has yet been announced.

*****
BABY MONITOR FINES

The FCC has fined the Fisher Price Division of the Quaker Oats Company $7000 for selling uncertified baby monitors. These monitors consist of a transmitter and receiver pair operating in the 49 MHz band. Both the transmitter and receiver section bore the same FCC identifier. For equipment of this type, approval is necessary for both the transmitter and the receiver.
The problem was with the receiver not the transmitter. A superheterodyne receiver in this type of device must undergo the notification process, where the FCC is notified of the intent to market. It in turn issues a product ID. But the FCC says that it had no record of the receiver. The forfeiture assessed was the base level fine for marketing of unauthorized equipment.
In another baby monitor action, the commission hit Eagletron Telecommunications, Ltd., of Hong Kong for an even larger penalty. The FCC's Sampling and Measurement Branch bought a baby monitor manufactured by Eagletron at a Toys 'R' Us outlet. Here, the problem was excessive emissions from the transmitters. The Eagletron transmitter had an excessively high fifth harmonic signal at 249 MHz. While it did not adjust the base penalty of $7,000, it did assess it for both the baby and parent transmitters, for a total forfeiture of $14,000. Both companies are expected to appeal.

*****
EMF CANCER SUIT DISMISSED

A San Diego jury has ruled that high voltage power lines were not the cause of cancer in a young child. The Superior Court jury deliberated only four hours before returning a verdict in favor of a local utility over the complaint filed by Ted and Michele Zuidema. The Zuidema's claimed that low frequency electromagnetic radiation generated by the power distribution lines running past their Le Mesa house had contributed to the development of their daughter Mallory's rare kidney tumors. The suit brought also accused San Diego Gas and Electric officials of failing to warn its customers of the potential health hazards of EMF radiation.
But the company's attorney countered by showing that there was no scientific evidence linking the childs tumors to power line radiation. He noted that over a hundred studies of EMF radiation have been conducted over the past two decades. Most have indicated the possibility of some health risk, but a majority of

scientists looking at the data say its inconclusive.

*****
WACO HAMS

At least two hams are now believed to have died in the fire at the Branch Dividian compound near Waco Texas on April 19th. The FBI has identified Jeffery C. Little and Douglas W. Martin as being among those who perished when the followers of cult leader David Korish set fire to the compound rather than surrender to federal authorities. Little held the callsign KJ5HJ and Martin is listed as KJ5HK. Both held Extra class licenses but local amateurs in the Waco area say that neither man had been heard on the air.

*****
NY TAXI

Word that the New York City Taxi and Limousine Commission has said no to a scheme to equip all of that city's cabs with two meter amateur radio gear. The idea for such a rule was presented to the commission back in February by three unidentified taxi drivers who claim to be the only individuals in the industry who use ham radio communications.
As you might expect, the concept was strongly opposed by many New York area hams. It was also shot down by the taxi industry magazine known as Driver. Driver took the position that amateur radio was not the answer to the personal communications needs of hackies. The magazine stated that ham radio operations are -- and we quote -- unique and limited form of communications, an expensive proposition and one which seems to have no use or need within the confines of taxicab. endquote.
While neither of the articles identified who the ham radio hackies are, it appears as if their attempt to make ham radio a tool of the New York Taxi industry is causing lots of negative fallout. One rumor is that the Taxi and Limousine Commission may soon face a demand from New York City hams calling for a total ban on taxi drivers carrying or using ham gear in their cabs.

******
U.K. BUST

Great Britain's Radiocommunications Agency has announced a successful prosecution of a ham for illegal out of band operation. The unidentified radio amateur was convicted under the Wireless Telegraphy Act 1949. He was fined a hundred pounds plus court costs and was ordered to forfeit his transceiver said to be worth an additional five hundred pounds. The prosecution, which was for using frequencies not covered by the defendant's license, came about following television interference complaints and followed several warnings.
The Radiocommunications Agency is also prosecuting another

radio amateur in a case which involves abuse of the amateur repeater network in the Midlands. The agency says that information supplied by the RSGB's Amateur Radio Observation Service was particularly helpful in preparing the case.

*****
INTRUDER REMOVED FROM 40

Also, as a result of help given to the Radio Society of Great Britain's Intruder Monitoring System by the United Kingdom Maritime Authorities another intruder has been removed from the forty meter band. This time it turned out to be a NATO Naval Vessel that was spotted by RSGB Monitors on 7.023 MHz.
This is the fifth intruder located and acted on in four months. It also shows that by cooperating with national authorities within the framework of the IARU Monitoring System intruders can be removed with great success.

******
RUSSIA TO LAUNCH ISRAELI SATELLITE

Russia has signed an agreement with Israel to launch a $3.5 million Israeli satellite designed by students at the Technion Institute of Technology in Haifa to improve global ham radio communications. According to AFP International, the rocket launch deal was signed by the Israel Space Agency and the Russian commercial space company, which will launch the rocket carrying the 115 lb spacecraft in March of 1995 In addition to a transponder for analog and digital communications, the satellite will be furnished with video surveying equipment for climate studies. The satellite in question is the widely heralded Israeli Techsat ham radio satellite. It's not whether this will be a dedicated launch or a secondary payload.

*****
NEW BOY SCOUT HOME STATION IN TEXAS

The Boy Scouts of America are getting a new headquarters station in Dallas, Texas. K2BSA will soon be located in a new building at Camp Wisdom on land owned by the Circle 10 Council of the Boy Scouts of America.
The new station comes as part of a deal with cellular common carrier Metrocel that permits the communications company to construct a cellular telephone site at the camp. As part of the agreement, Metrocel agreed to build the new Boy Scout ham radio communications center and to maintain it. Included in the deal is a 125 foot high tower that will be the home of both the Metrocel and K2BSA antennas.
If construction is on schedule, the new K2BSA should be operational in time to take part in the Word-Wide Jamboree On The Air taking place on October 16th and 17th. K2BSA will also be operational from Ft. A.P. Hill this August.

*****
YAESU DX

In DX, if you are looking for some of the Caribbean Islands, then you can work many of them this week thanks to the folks at Yaesu. Beginning on the 16th and continuing through the 22nd, a group of average hams will be finding out what its like to be Big Gun DXers on the other side of the pile-up as Yaesu kicks off its first ever Caribbean DXpedition.
According to Karamanos, there is no special callsign for the operation. Arrangements have been made with the governing body of each island nation for blanking operating privileges. This will allow each of the operators the advantage of using his own call and handling his own QSL's. Look for the Yaesu Caribbean DXpedition on the usual DX frequencies plus the ten meter Novice phone band and on the Oscar satellites.

*****
W6NAZ S.K

We preceded last weeks newscast with a special advisory that said former radio drama actress Lenore Jensen, W6NAZ had died on May 5th in Sherman Oaks, California. Lenore was 79 years old when she passed away. She was the widow of retired Broadcast Engineer Robert Jensen, W6VGQ, and in her own right was known as one of Amateur Radio's premier ambassadors of good will worldwide.
Lenore was first licensed in 1939 as W9CHD in Chicago where she was known as Lenore Kingston and worked as a contract actress for NBC. She received the callsign W2NAZ when she moved to New York City in 1940. Lenore became W6NAZ after World War Two when she and her first husband Joe Conn, W2MSC, moved to Los Angeles. Most of Lenore's operating involved message handling and phone patching. According to a profile in the December 1987 issue of QST, Lenore ran over 68,000 Army MARS phone patches during the Vietnam War. She was also one of the thirteen surviving founding members of the Young Ladies Radio League, and the 1983 Dayton Amateur Radio Association's Special Achievement Award winner for -- and we quote "...her dedication in service to others through the medium of Amateur Radio."
From the mid 1970's until her death, Lenore efforts were especially important to the Amateur Radio public relations effort. Her long and highly successful career in the entertainment industry permitted her access to many stars and celebrities who later appeared in ARRL released Public Service Announcements. Lenore also appeared in several ARRL films and video's including the award winning "World of Amateur Radio" produced by Dave Bell, W6AQ in 1979. W6NAZ was a regular contributing writer to Worldradio News magazine and anchored a number of Newsline broadcasts back in the late 70's and early 1980's when we were still known as Westlink Radio.
To us at Newsline, Lenore Jensen, W6NAZ was more than just another voice on the radio. We had the honor of knowing her

personally. She was a warm, charming and intelligent human being
that we immediately came to respect, and to love. Even though
you may not have heard her regularly on our newscasts, Lenore was
an important part of our Newsline family. Her passing leaves a
void in all of our hearts. We miss her and we promise to never
forget who she was, what she accomplished and the living legacy
that she has left for all radio amateurs, worldwide.
We have been asked to announce that in lieu of flowers,
memorial donations may be made in Lenore's name to the ARRL
Foundation, the Los Angeles Recordings for the Blind Association
or the American Cancer Society.

system@mooch.sbs.com (Christopher Ogren) writes:
:
: True there exists no speed requirment in an international sense.
: Actually these are International Agreements. International Law is a
: very gray area. There does not really exist any true enforcing body.
: The UN may be construed by some in this way but it is more of a political
: body. I suppose code could fall under the Laws of the Seas which are

If so we are in big trouble, the fcc just said there is no more guarantee
that marine morse code messages will be monitored. I don't recall the
exact ramifications or extent of this policy/rule change but perhaps
someone else does.

: certain standards which they felt were appropriate. But the fact still
: stands that Morse Code according to the international community is still
: an important means on communication on the HF frequencies. The IARU
: just reaffirmed this too.

Yes it is and probably will be for a very long time. As has been pointed
out on numerous occasions receivers can be built very inexpensively and it
can be used in poor band conditions. But voice, packet etc. are also very
important means of communications on the HF frequencies. You CAN get a
license to work on HF wothout proving a certain level of skill at
communicating with these modes. Why should morse code receive special
attention.

: > I didn't realize it was against the unwritten code to help other amateurs
: > with solder jobs etc. that they are unable to do for themselves.
spelling corrected above! It was mine! ;-)
: You missed the point entirely. It is one thing to help an amatuer with
: a solder job. I often do this myself. But he was making a point that
: it is a sad state of affairs when an amateur cannot even put a connector
: on coax. IT IS NOT DIFFICULT! This should be able to be accomplished
: by any license class right down to novice. Geez, get an ARRL handbook
: and follow it's intructions for putting on a connector. It is pretty
: clear if you can read English. Mybe they are nervous of messing up but
: that's ok too. That's how a person can learn sometimes...by their
: mistakes. It's not like coax is very expensive.

NO! you missed the point. there was no reference to the amateurs license
class or anything else. It is true that there are a lot of amateurs that
know very little of what you and I think they should. And we probably
agree on most of those things. But that has nothing to do with what
license class they hold. The license class was implied to be technician
but I would guess that the original poster doesn't even know. Further more
these are things that need to be addressed in the technical portion of the

exam. I fail to see a correlation between learning a "language" and
soldering a coaxial connector.

: JJust yesterday on my way to work I was listening to two amateurs talk
: about mulit-mode data controllers. One was affraid to install his new
: MFJ 1278 because he couldn't figure out how to make a cord for keying
: the tx or receiving audio. Now come on folks. That is really sad. It
: is very very very basic. Any amateur (in theory) should be able to

They must not have been no-coders unless:
1) There's a no-code technician that actually paid your $4,000 dues
2) They were actually smart enough to figure out your PL on their own
3) You actually listen to repeaters who accept no-codes on.
4) perhaps you are not quite as elitist and hateful as your co-workers

I really hope it is 4!!
[Point of agreement left out for (brevity?)]

: > Many people are violently against the right thing look at the freedom
: > riders in the south. I'm not drawing a direct comparison but realize that
: > just because a majority of a group want something to happen means that is
: > the right thing.
:
: OH really! I would have to disagree with you there. So you could also
: justify that argument in South Africa. Couldn't you? Being that we are
: a democracy what the "people" want is always the RIGHT thing. Whether
: or not that causes harm to ourselves at some point is of lesser
: importance. We cause more harm to ourselves by abandoning our belief
: in majority rule.

You seem ti misunderstand I meant that the southern *Majority* was wrong
not the freedom riders! And you are right, I can apply the same to S.A.
Just because the "majority" (I realize they aren't really) want apartheid
doesn't mean it is a defensible position. NO! what the "people" want is
not always the right thing, in fact one of the major reasons for the
judiciary branch of our government is to protect the rights of the
minority from the whim of the majority. Even the legislature understands
this. Remember, the senate is not population based. Can you say
filibuster? (not sure I can spell it :-) If you ever read the federalists
papers you would know that simple majority rule was NOT the intention at all.

[Two more points of agreement not covered]

: It seems a bunch of people think SBS sites only bash. We practice what
: we preach here in RI. We are part of an 2 meter FM code practice net
: and also work with the Ocean State Amateur's Net which attempts to
: answer any and all questions amteurs have regarding policy, theory, or
: operating tips. We especially encourage new amateur's to check in every
: week. Yes, we unsing SBS sites might seem critical but we practice what
: we preach! I am not some P.C. wishy washy ham who likes to see things
: going down the toilet like they are.

If I felt that were the case I would have killed all files from that site.
There is one person at your site who has acted as such an ass as to no
longer rec. replies to most of his posts, from anybody. You seem to
be willing to discuss the topic openly and reasonably. I hope that
doesn't lose you any friends at work :-) I am glad that you practice
what you preach. If we all did that it would be much easier to tell the
jerks from the sincere. As far as P.C. goes, what have I said that made
you feel I wanted you to edit yourself in a way to prevent you from
voicing your opinion as you see fit? I am very much against PC because it
hides the bigots, racists, homophobes, xenophobes, anti-semites etc.
behind euphamisms.

How's a Honda Accord w/50W VHF?

Not bad, with mustard and lettuce.

(Sorry, but I couldn't resist)

>reccomend this to anyone with the money.

> - Nick
I owned one of these rigs for a couple of months and I didn't really like it.

However, I bought off a less than reputable guy...he's one of these CB-HAM
types and I think he'd been inside it to "tune it up a bit." Mine had a bad
problem with FMing in SSB modes. The rig worked great other than that.
It was already modified to cover 26-32 and LOCKing into CB. My basic
complaints of the rig are one, it's BIG. Two, it doesn't give the option
to diable the clarifier...which on this rig, I think it was a SLIDER and not
really a RIT. I didn't like the two controls thing...where it had a knob and
then that stupid thing on the outside that spun around, too. The controls
were kinda flakey, too. I now own a 2600 which I think is a far better rig.
The controls are more user friendly, and more designed as a ham rig and not
a CB. But, if one can find a 2950 for a good price, I'd nab it!

>I'm pretty sure it's not fluorescent lights... they're neon. I've seen
>it around license plates and under cars too.

I believe that they are actually fluorescent. They look like neon signs, but neon signs are on the way out. Most of the "neon" things you see today are fluorescents with different colored phosphors (telephones that light up when ringing, the car things, most small "neon" shop signs, etc.) Neon only has a very limited set of colors, the red being the most efficient.

>Sure incentive licensing makes sense. The idea was put forward to
>increase the number of persons who had a special skill such as Morse
>Code. Anyone can press a mic button and blab.

Yeah, but morse code is a pretty useless skill to encourage. Sure, it's great for DXCC, but compared with real skills like computer programming, microwave technology, and the like it pales. Ham radio should increase useful skills in the amateur population, not useless ones.

>Even if code was dropped all together as an exam requirement (can't be
>done because of international agreements) the exmas should at least be
>made worthy of the knowledge an amateur radio operator is suppose to
>posess.

I'll agree with that...kill the code requirements except for 5 WPM for HF privs, and then make real tests for general, advanced, and extra.

2663. Question about the antenna

Newsgroup: rec.radio.amateur.misc
Date: 1993-05-17 04:38:31 UTC
From: wong@a.chem.upenn.edu
Message-ID: <127108@netnews.upenn.edu>
Source record: 281523

I have a magnet mount antenna base and two steel whips. The whips are both
160cm long. I would like to use one for 11m (CB) and the other for 10m.
The question is how should I adjust the length for each of the whip
that will optimize the transmission?

2664. If you didn't get a copy of the CFV...

Newsgroup: rec.radio.amateur.misc
Date: 1993-05-17 05:25:15 UTC
From: ikluft@uts.amdahl.com
Message-ID: <330J03xTd2x300@amdahl.uts.amdahl.com>
Source record: 281520
Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.packet,rec.radio.amateur.policy

I mentioned a couple days ago that I made a mail server for the CFV since a number of people asked me for copies. I sent out a bunch of them manually and then set up this server. Well... it worked fine when I tested it. :-(There was a setup error that resulted in this output for everyone but me:

```
>--copy of CFV-----------------------------------------------------------------
>[the mailer script was not able to open this file]
>-----------------------------------------------------------------------------
```

Needless to say, that isn't even an abridged version of it! I've fixed the error. (The directory permissions were accidentally set so it would only work if *I* sent mail to it. I hate it when that happens!)

It will work now. If you want a copy of the CFV, as posted by the moderator of news.announce.newgroups, send mail to

cfv-request@uts.amdahl.com

The script won't read your mail. It will just look at the reply address and send you a complete copy of the CFV.

My sincere apologies to anyone who sent requests and got the error back!

Source record: 281524

Field Day is coming up, and we at the U of Maryland ARC are looking
for a good site within a few hours drive from MD. We're looking
for someplace new, preferably in the mountains. Of course, we need
to be able to put up antennas (wire dipoles, and beams if we can
find the proper place to attach them to), camp, perhaps run our newly
donated generator, etc.

Does anyone know of such a nice mountainy site out to the west of
Washington, D.C. which would be apropos for field day ops?
(No Park Rangers complaining about antennas please :)

The current CQ Special Edition has the following info on the HTX-404:

Narrow receiver front end
True FM modulation
CTCSS encode & decode
DTMF paging
prog. power saver
9 DTMF memory sequences
multi-function scanning
prog. freq. steps

Display: backlit LCD with indicators for
freq.,mem ch., DTMF memory.,CTCSS, S/RF relative power, TX offset

Specifications: receive range 440-450 MHz, transmit range 440-450 MHz
power output 5w
IFs 2
sensitivity 0.2 uV for 12 dB SINAD
supply voltage 7.2-15 Vdc
max. current 1.8 A
dimensions 4.6" x 2.6" x 1.9"
weight 1.2 lbs

$299

>
Heres an easy way..

Use a bridge rectifier for each transformer, common the negative outputs,
and feed each positive output from a bridge thru a diode to a common point.

Using this setup, as the output is loaded, the transformer with the
higher voltage will drop its voltage, to meet the one with the lower
voltage. At high loads both will be conducting.

Many of the so-called "ham HTs" are not _just_ ham HTs. One of the reasons
HT manufacturers have "hidden features" is that they sell the same radio
plus or minus a couple of solder bridges or prom changes to the commercial
markets all over the world.

2673. Quad Antenna Info pse

Newsgroup: rec.radio.amateur.misc
Date: 1993-05-17 12:15:16 UTC
From: fax%sparc4@Olivetti.COM
Message-ID: <9305171215.AA01684@sparc4.ICO.OLIVETTI.COM>
Source record: 281264

Ciao,
I'm considering to buy a beam and some days ago I had the chance to take a look to a Cubex Quad (mod. MK5-PTD3 five bands/3 el) antenna tech specs. Actually, since I always thought to buy a yagi, I never took under serious consideration a quad and I was pretty amazed by the on-the-paper performance. Infacts, its gain is rated 11-13 dbISO, F/B 35-40 db and a very low rotating radius (and that's just great for my QTH).
I'm wondering if any of you out there can give me any advice on this antenna or, more generally, whether quads work better than yagis under any condition or there is a trade off like more weakness to the wind, etc. etc.

I would also appreciate any comment/suggestion on other makes, or even any kind of ant that can rotate with radius of about 4 meters with a good gain. Height is not a problem since the tower can be almost as high as I want with a minimum of pain.

AGCW-DL ACTIVITY WEEK

Date: Yearly in the week before Whitsun.
1993: 24th of may '93 to 28th of may '93

Time: Mon 00.00 UTC thru Fri 24.00 UTC.

Frequencies: HF: 1,8 MHz to 28 MHz, including WARC-bands.
V/UHF: 144 MHz to 430 MHz.

Operation: CW only! Normal QSOs (no contest style)
with exchange of RST, QTH and name. Don't use
serial numbers!

Remarks: Only straight keys, bugs and elbugs are allowed.
Do not use any keyboards or any other kind of
equipment encoding and/or decoding automatically.
Disregarding this rule so will cause disqualification!
The participant confirms the consent with the rules by
putting a signature on the log.

QSO Points: Every QSO will count one point.

Final score: Sum of QSO points.

Logs: The logs have to contain following columns:

Call | Date | Time | Band | R S T sent | R S T rcvd | Name

We would like to know what rig was used during this activity week. So
please be so kind to add a small description of the rig you used.

SWL Logs have to include both calls and at least one signal report!

Sense of contest: during this activity week there will be no scoring
in classes or bands but everyone reaching more than ten points will
receive a contest testifying card and those OPs who reach more than
fifty points will get an award.

Deadline: Deadline is four weeks after activity weeks end.
Please send your logs to this address:

2676. The Bowtie Filter Confusion

Newsgroup: rec.radio.amateur.misc
Date: 1993-05-17 12:44:13 UTC
From: jwa@tellabs.com
Message-ID: <1993May17.124413.7580@tellab5.tellabs.com>
Source record: 281353

People are confusing the bowtie filter with the X display
that appeared in the spring issue of Communications Quarterly.
It was also mentioned in the October 1965 issue of QST.

The X display is a filter circuit that drives an X/Y
oscilloscope for accurate tuning of FSK signals. The new
version (in CQ) uses a solid state op-amp Gyrator circuit.

The bowtie filter is a circuit that uses the tone filters in
the TU or TNC to obtain an accurate display. It also corrects
other problems such as mark/space channel separation and the
phase tilt that distorts the crossed ellips or "footballs".

It actually increases the discriminator output and provides the
bowtie display down to 10 Hz shift. When the receiver is tuned
to a carrier in SSB mode, you can adjust the hetrodyne to the mark
tone. The bowtie will display a - or a horizontal line. When you
tune from a mark to a space the line changes from horizontal to
a diagonal \ to a vertical | line. In fact, if you can set your
TNC to 30 Hz shift, as your receiver tunes in 10 Hz shifts, you
would see the bowtie change in 3 evenly spaced angles from 135 to
150 to 165 to 180 degrees.

The bowtie works great with H.F. packet. You can precisely tune the
filters dead center on the mark and space frequency. I found that
this is an advantage. If any tone filter are mistuned by as much
as 20 Hz the error rate increases. The bowtie filter is available
for the Universal M7000 and M8000 and plans are in the works for
PK232 and KAM add on boards.

Source record: 281410
Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.packet

I want to use a Radio Shack HTX 202 on packet and I need info
on the tnc connections. Do I use a .1 ufd in parallel with a
2.2 K resistor (like Yaesu)? I tried to use my ICOM HT connector
(.1 in parallel with 3.9K) and the RS HT did not key up.

Also, How does one change the calling channel memory? I can write
data into any memory except the calling memory.

Respond to me via e-mail please, I'm 5 days behind reading news!
tnx Shel dara@physics.att.com

>thru packet?

There is a newsgroup which you might not know about, called
alt.internet.access.wanted. It is perfect for your query.
(I realize you may not have access to that group, in which case
that would be why you did not post to it.)
Anyway, if you can I suggest you post to that group.

If you are not able to post to that group directly, you may
wish to consider using one of the services that lets you post
via email. For example, you could post to

alt.internet.access.wanted.usenet@decwrl.dec.com

and state in your posting that you would like to get responses
via email.

Best of luck.

Well, I'll repost as follows:
==========

Radio Shack HTX-404 440 MHz (70 cm) Amateur UHF FM Transceiver
(Cat. No. 19-1140)

If you look at your latest copy of QST, you will find a review of
the new Radio Shack 440 MHz scanner. This is a brief summary of
the transceiver's specs. When I made a similar posting about the
HTX-202 when it first came out, I received complaints that I was
'promoting.' Note that this posting is not intended to promote, but
to inform the amateurs on the net of the unit's listed specs. I
apologize in advance to anyone that has a different definition
of 'promoting' that would include this post.

(These won't be available in quantity until mid-Summer.)

SPECIFICATIONS

General
Frequency Range ..... 440 - 450 MHz (Modifiable
to 430 - 450 MHz)
Frequency Steps ..... 5/10/15/20/25/50/100 kHz
Frequency Stability ..... +/- 10 ppm
Antenna Impedance ..... 50 Ohms Unbalanced
Speaker ..... 8 Ohms
Microphone ..... Condenser Mic, 1.2 kOhms
Channel Display ..... LCD 8 digits
Operating Temperature ..... 14 to 140 deg F
Size ..... 2 9/16 x 4 5/8 x 1 7/8 Inches
Weight ..... 1 lb, 3 ozs
Supply Voltage
Alkaline Battery Pack ..... 9 VDC
Ni-Cad Batter Pack (600 mAh) 7.2 VDC
External Power Jack ..... 7.2 to 13.8 VDC

Receiver
1st IF ..... 45 MHz
2nd IF ..... 455 kHz

David, Vocomm used to market a bracket like you describe. I don't know
if there are any others. They are expensive. You can adapt the RS bracket
by using a couple of General Radio hermaphroditic N connectors.

Source record: 281349

In article <127108@netnews.upenn.edu> wong@a.chem.upenn.edu (Weichyun Wong) writes:
>I have a magnet mount antenna base and two steel whips. The whips are both
>160cm long. I would like to use one for 11m (CB) and the other for 10m.
>The question is how should I adjust the length for each of the whip
>that will optimize the transmission?

Well they are both too short to be used as 1/4 wave whips on either
band. For 11 meters the whip should be 274 cm, and for 10 meters it
should be between 250 and 267 cm depending on what part of the band
you wish resonance. Mounting whips that size would take a heck of a
mag mount, though I've seen one that works that uses 4 10 cm magnets.

If the "base" is really a loading coil for CB, then you'll have to
either follow the manufacturer's instructions for whip length for
CB and trim the other whip for 10 meters by scaling about 10% shorter,
or you'll have to cut and try with a VSWR bridge. Without knowing the
coil inductance, that's as far as we can go in giving advice.

>> manufacturers knowingly engineer and manufacture radios that can do this?

I have a slightly different question: to what use do hams put these our-of-band
frequencies?

I ask because when I picked up my Yaesu FT-530 this weekend (my first HT), the
first thing the sales person asked after I paid for it was whether I wanted
a 'mod sheet'. Well, this mod will allow me to transmit in the heart of the
public service bands in my area. Now, I imagine in the direst of emergencies
it might be ok to do this. However, I would be a little worried about accidently
keying the mic on the local police repeater (DISPATCH: all city and county units
move to BLUE; we have a stuck mic on GREEN) since I also like to scan the public
service freqs. Any ideas? (BTW: I just passed my exam last week, so be nice
if this question is painfully obvious.)

Source record: 281334

Although Luxembourg/LX cannot be considered a rare country,
there are not too many locals operating on CW. Best opportunities
to get LX on this mode is still a contest activity.

I will be operating from Luxembourg on Saturday June 5 and Sunday
June 6 during the Region 1 Field Day using the call LX/DL3ZBJ/P.
A n y call is welcome at a n y (reasonable) speed (1 to 50 wpm).
If you use slow speed so will I, and vice versa.
15 and 20 mtrs should be fine, perhaps also 40.
Please exchange a serial number.
The contest is a CW only activity although I do have a mike
mike with me and will use it.
All incoming QSL cards will be answered via the bureau 100 %.

73 and cu on the bands, Wolf.

>via computer so that it can be operated from a remote site by
>members of the club.
>
>We want reports on the good AND the perceived bad tranceivers
>that are presently available on the new or used market.

Well I use the FT736R and think it's very nice. It has the CAT
system and it's basic RF performance is good. I had the Kenwood
790A, and it has a computer interface, but I found it's manual
control system flawed, and it's RF performance lacking. Notably
it's RF output modules show poor efficiency, it's thermal system
is inadequate, and it's dual tracking control method is poor.

I didn't use either totally remotely controlled, so I can't comment
directly on any problems you may encounter in doing so. I'd be
inclined to go with the radio with the best raw RF performance,
and the best duty cycle, if the computer control aspects are otherwise
satisfactory.

2691. positive-reacting photoresists -- info request

Newsgroup: rec.radio.amateur.misc
Date: 1993-05-17 14:53:14 UTC
From: kawai@Csli.Stanford.EDU
Message-ID: <1993May17.145314.26916@Csli.Stanford.EDU>
Source record: 281344

Dear all

Does anybody know of suppliers or vendors that carry photosensitized circuit boards with positive-reacting resists?

Or, are there copier machines that can make negatives -- that is, black images come out white, and vice versa? If anybody knows of photocopy shop in the San Francisco Bay Area that has one, please let me know.

The reason I'm asking is because I have several positives for a homebrew project, and my photosensitized circuit boards are negative-reacting. (They're made by Kepro.)

I know that Kepro has a positive-to-negative conversion kit, but I have so many positive images that I'd rather go for positive-reacting photoresists than convert from positives to negatives.

I'd appreciate any help.

2692. 3NK Jr. Antenna question

Newsgroup: rec.radio.amateur.misc
Date: 1993-05-17 14:55:31 UTC
From: anderson@dseg.ti.com
Message-ID: <C76EsK.IqJ@m2.dseg.ti.com>
Source record: 281345

A friend of mine has a high swr problem with his 3NK Jr. beam.
He says that his rig works fine when he hooks it to other beams
but not with his. Others with the same rig are getting out
fine, but he isn't. We are wondering if he might need to repair
it by replacing the traps and balum.

The antenna is located in the bush in Papua New Guinea, so it
is a fairly harsh environment and he doesn't have many parts
available or other help.

Has anyone seen this kind of problem? Are these parts
available? where whould we go about finding them. Should
he replace any other parts while at it?

He is considering replacing the beam if this doesn't solve
the problem. Before he makes the fix, he needs to know if it
can be done and is worth it.

Any comments on this problem would be welcome.

Thanks

2693. Don't get ripped off by a G5RV

Newsgroup: rec.radio.amateur.misc
Date: 1993-05-17 15:01:38 UTC
From: epacyna@auratek.UUCP
Message-ID: <1111@auratek.UUCP>
Source record: 281357

The G5RV is only an antenna on 20M. On this band its a 3/2 wavelength antenna and the SWR is 2.8:1. If you look in transmission line chapter of the ARRL handbook, you will find a table showing the loss per 100' of popular coax feedlines. The loss is specified for matched 50 ohm systems. So you'll also need to look at the graph that shows the incremental loss due to SWR that must be added. Note: SWR's only up to 20:1 are shown. Because its a 3/2 wave length the G5RV has a little bit of gain on 20M which is offsett by the transmission line loss. So the G5RV on 20M works no better than a more compact 20M dipole.

The G5RV is not a multiband antenna. Using MININEC, I modeled this antenna and the SWR is much to high to be using coax feed. The SWR varied between 50:1 to 100:1 on all the other bands! The transmission line loss now becomes significant. The G5RV is now part antenna and part dummy load. Your 100W station is now QRP. With a 6dB loss, only 6.25W will reach the your antenna; and a 9 dB loss will only get 3W (97% loss) to the antenna.

Also, under high SWR conditions, the voltages on the line become quite high. Running high power on this antenna will exceed the voltage rating of most popular coax.

Power necessitates responsibility. Not an insult or anything, just a
statement of fact. If I have a loaded gun, and I want people to trust
me around them, I had better be EXTRA-careful and EXTRA-responsible.

Similarly, when scanning out of band (if your radio transmits out-of-band)
it may be a good idea to lock the transmitter (TX stop/TX lock). Or
keep your clumsy fingers away from the PTT button (my problem).

Fortunately, my HT doesn't transmit beyond 140-151 MHz, although the
receiver is open from 0.00 to 1312.00 MHz (even though the PLL doesn't
lock for most of that range).

Congratulations!

Hi folks .. original poster here.

This has been a very interesting and enlightening thread on RFI - and now that I am working on reducing some whine in my new installation, I can make use of the info.

The problem (now don't shoot me :) is that I decided on a Camry instead of the Accord. And this may have been a mistake as far as radio is concerned.

I have the rig in there and all is working fine, but I'm hearing that there is some concern regarding the car's CPUs. There are at lease 3: Air Bag CPU, ABS CPU and fuel injector CPU. While driving down the road I keyed up with 50W and the air bag didn't explode and the brakes still work :) However, I am trying to follow up with the manufacturer (without much luck) regarding installation of radios.

The air-bag computer is installed under the passenger seat and the feed line to the trunk-lip is running down the base plate at the passenger door. This may have to be rerouted, but the owner manual showed this CPU in the console between the seats; I didn't notice this error until the installation was complete. I taped power from the fuse box to only work on accessory and outside of a very little whine on high power (which I'll hopefully correct with a filter) that seems to be just fine.

Anyway, from another Camry owner, I heard everything should be ok below 100W. Can anyone add to this or will my car be 'taken out' buy a passing ham two-lanes away :)

73,
Gene

>> CURRENTLY ASSIGNED. IT'S ADJACENT TO OUR 10 METER ALLOCATION and it's
>> probably not a very attractive area for commercial applications..hence
>> the price should be low enough to allow the Amateur community to afford
>> it without worrying about the CBers outbidding us.

We don't need 11 meters, even if we could get it. We have 12 meters and
10 meters. 12m has better propagation characteristics than 11m and
is much less crowded. 12m and 17m are quiet, friendly islands of sanity
in the overcrowded spectrum.

I don't think 11m is for sale anyway. I believe the proposal is to sell
unallocated bandwidth. There is no way we could outbid Uniden,
Radio Shack, and other CB manufacturers anyway.

Mark-

About 15 years ago, I built up an SCA kit from South West Technical. I used an old monaural FM tuner. It had an output for a stereo decoder which worked to feed the adapter.

A technique for reducing noise in FM systems, uses pre-emphasis and de-emphasis networks. High frequency audio is emphasized in the transmitter. The receiver's network de-emphasizes high frequencies, which also reduces the "hiss". Unfortunately, it also reduces the sub carriers!

Therefore, you must connect to the FM detecter's output, prior to the de-emphasis filter. To avoid overloading the receiver's circuit, I suggest using a small coupling capacitor, maybe around 100 picofarads, maybe less.

>other than as a cus(s)tomer.

When I worked for RS, they had two major price tag printings per year and one catalog printing per year. This means that price tags can be delivered up to 6 months in advance of having the product. The goal was to get stuff in stock by the Xmas season, so most new products started coming in around September or October. When they introduced the 2m HT, the price tag was seen in stores about 6 months before the product became generally available. I hope that they are quicker with the new 70cm HT, but don't bet on it.

I am very glad to see RS come out with a 70cm HT. Even in the SF area, this band is under-utilized. Hopefully better rig availability will promote the use of this band and help relieve overcrowding on 2m.

Message-ID: <1t8jljINNiib@inferno>
Source record: 281186

I bought a Motorola Sytor commercial mobile tranceiver that I'd like to migrate to the ham band (UHF). I have the manual, but what I am looking for is the layout of the data information in the frequency EPROM. I suppose I can try to hack at it myself, but if anyone has already done it, it sure would be helpful. The goal is to be able to zap a PROM in a promburner instead of having to go to a Motorola dealer to have it done on their tool.

Please reply by email to 74066.2004@compuserve.com instead of the address on this message's header.

Thanks in advance,

Larry Rachman, WA2BUX

Reports from other hams, as well as my experience, shows that G5RV
works with acceptable SWR (in my case < 3:1) on all bands, and a low
SWR on some bands (in my case close to 1:1 on 7-21MHz). If MININEC
does not show this, there is a problem with MININEC or its G5RV file.
Observation has priority over theory!

writes:
->:Not me! If you have an open wound on each hand, the 12v battery, in contact
->:with each wound, will kill you just fine. It's the current that kills you;
->:it's your skin's resistance that keeps the low voltages from building up
->:enough current to harm you, usually.
->:
->:The resistance of the essentially salt water that is beneath your skin is very
->:low. A 12 volt battery can produce more than enough current through damaged
->:skin to disrupt your heart.
->
-> From the Merck Manual, Fourteenth Edition, page 2134:
-> "Dry, well-keratinized, intact skin may have a resistance of several
->hundred thousand ohms, whereas the resistance of moist, thin skin is about
->500 ohms. If the skin is punctured (e.g., from a cut or abrasion, or by a
->needle), or if current is applied to moist mucous membranes (e.g., mouth,
->rectum, vagina), the [body] resistance may be as low as 200 to 300 ohms."

Basically, Merck aren't engineers, consequently, they didn't bother to tell
you important little things like electrode placement, size... They provided
this information for general information purposes. They didn't expect you to
use it for calculating power dissipation in a pancreas at 12 volts.

The body's internal resistance varies all over the place depending on how big
the "electrodes" are, how deep they penetrate, and how far they are apart,
their proximity to major muscles, veins, organs...

->:12v sources terminals, or circuitry. It happens to mechanics from time to
->:time, when wrenches slip, or hands get burned and quickly withdraw.

No, in my scenerio: the wrenched slipped, and the muscle force applied to
turn the wrench drove the hand into a sharp immovable "electrode"; or the
hand got thermally burned (hot manifold), and the spinal reflex caused the
hand to withdraw violently, forcing the hand/elbow into a sharp immovable
"electrode".

->
-> It's usually a combination of the bright spark (scary, makes you jump)

This is yet another method of propelling your hand/elbow into a sharp
contact.

-> Believe me, I've both wet my arms and chest and held the battery
->terminals as a demonstration, I've also had the misfortune of shorting

You are still well protected by the inherent high resistance of your skin, even when wet. See your above data.

If you want to do the real demonstration, you will have to badly cut your elbow on the body of your car, and simultaneously drive your palm into a sharp 12v battery terminal (the starter solenoid will do). Your heart will stop.

>
> Can anyone post a nice, complete, accurate, succinct explanation of exactly
> what it is and how it works, all in one article meant for us antenna
> fumblefinger types to save for all eternity?
> --

Basically, polarization refers to the pattern that the electric field traces as it propagates through space. The electric field changes in both magnitude and direction as the wave travels through space.

Linear polarization is when the electric field lies entirely in one line. Typically, you hear of horizontal and vertical polarization -- these are linearly polarized waves. Horizontal means the electric field is in the horizontal plane, and vertical meaning the electric field is in the vertical plane. The direction of the electric field is always on this line, but the magnitude changes over time.

Now, for elliptical polarization, the electrical field is contained in two planes. This plane is perpendicular to the direction of propagation. If you look at the electric field at any one instance in time, it will have a magnitude and direction. This magnitude and direction changes over time; if you plot out these changes over a sufficient time interval, the plot will take the form of an ellipse. Circular polarization is a special case of elliptical polarization, because a circle is an ellipse whose major and minor axis are equal.

You can also characterize the circularly polarized field by the direction that the electric field moves around the circle. Looking in the direction of propagation, if the field moves clockwise around the circle, it is termed a right hand circularly polarized wave. If it moves counterclockwise, then it is a left hand circularly polarized wave.

Polarization is very important. One of the losses in a communication link is due to polarization mismatches. For example, commercial TV broadcasts from antennas that are horizontally polarized. The receiving antenna also must be horizontally polarized, or else there will be a high polarization mismatch loss. This is why you install a TV antenna horizontally rather then vertically. Similiarly, 2 meter repeaters have vertically polarized antennas, so your 2 meter antenna should be vertically polarized.

Elliptical (circular) polarization is typically used for satellite communications. A typical antenna that generates a circularly polarized wave is the helical antenna. If you look at the direction of the winding of the helix in the direction of propagation, you can tell if it is a right hand or left hand polarized antenna.

One of the interesting things about elliptical polarization is reflections off a surface -- they can change the direction of polarization (right hand to left hand).

Now, without getting into vectors and some more antenna theory, this should give a general description of polarization.

-I have been reading quite a lot here about how various HT's and scanners and
-such are modify-able. As the HTs are concerned, a user may modify the radio to
-transmit outside of designated amateur bands. My question is WHY do
-manufacturers knowingly engineer and manufacture radios that can do this?

No real technical reason (the HTX-202 can only transmit or receive on the
2M band), but there are a few good reasons. Ham bands vary around the
world, and this way onde design, with different diodes or jumpers) will work
anywhere. Also, this gives you more freedom when designing transverters to
work on other bands.

Does anyone know why Icom required me to perform the out-of-band mod on
my 24at in order to transmit within the ham band at 439 MHz?

Several kind souls directed me to 129.180.4.7 (grivel.une.edu.au)
I have downloaded two programs that I found useful. Morse Mania and
MORSE CODE TUTOR both are good but so far nothing matches Super Morse for
the PC.

Also, the programs are in pub/ham-radio/mac-files

On another note, maybe sources of mac programs for amateur radio should be
in the FAQ or some kind of regularly posted document. Any volunteers? If
not, send what you know to me and I'll compile something.

eesnyder@boulder.Colorado.EDU (Eric E. Snyder) posts:

>I have a slightly different question: to what use do hams
>put these our-of-band frequencies?

There are legitimate and illegitimate uses for out-of-band mods.

Legitimate: Hams participate in Civil Air Patrol and Military
Affiliate Radio Service (MARS) radio nets that
use frequencies a few MHz above or below the amateur
2-meter band.

Illegitimate: Some hams have business-band or emergency-service
licenses or authorizations and use their ham HT's
on those channels instead of the very expensive
(~$2000) commercial HT's. This is a violation
of FCC rules since commercial radios must be
type-accepted for those services. Ham HT's
with their user-adjustable frequency selectors
are not and will never be type-accepted. (But
they generally work OK).

In case you are wondering, you have just found one of the big
"controlled substance" problems of amateur radio. And you thought
this kind of stuff only happened on Alt.Drugs :-).

>this. However, I would be a little worried about
>accidently keying the mic on the local police repeater
>(DISPATCH: all city and county units move to BLUE; we have
>a stuck mic on GREEN) since I also like to scan the public
>service freqs. Any ideas?

If you read your manual carefully, I *think* you might find that the
530 already *receives* most of the public service frequencies. So
you really don't have to enable the out-of-band transmit capability
to monitor. And this alleviates the risk of jamming the very people
you are trying to listen to.

>(BTW: I just passed my exam
>last week, so be nice if this question is painfully
>obvious.)

Congrats on getting the license and welcome to the fray.

I think there is some stuff in the FAQ about this (or there should be).
But this has also been a hot topic in the group over the past
few months, so it's still fair game.

(BTW, originally tried to mail this, but mail-wise we seem to have
dropped out of the visible universe.)

Ohio/Penn DX Bulletin No. 111

The Ohio/Penn Dx PacketCluster
DX Bulletin No. 111
BID: $OPDX.111
May 17, 1993
Editor Tedd Mirgliotta, KB8NW
Provided by BARF-80 BBS Cleveland, Ohio
Online at 216-237-8208 14400/9600/2400/1200/300 8/N/1

Thanks to the Northern Ohio Amateur Radio Society, Northern Ohio DX Association, Ohio/Penn PacketCluster Network, DF4RD, HB9BLZ, AD1C, and N8HTT for the following DX information.

9M0S, SPRATLY ISLANDS. The latest on the 9M0S DXpedition is that OH2BH and crew plan to depart from Malaysia by boat, May 26th. The operation will begin sometime after that date. Meanwhile, there have been reports of Marrti, OH2BH, from Aruba signing P4/AH3D. He is attending the Yaesu DX-Caribe Cruise, so expect to see him and others active from other Caribbean islands.

C5, The GAMBIA. Falk, DL7UTA (a new NODXA member), and Roy, DL7UBA, will be active from here, June 14-31. They will be signing C56/DL7UTA and C56/DL7UBA, and be active on 160-10 meters, CW/SSB. QSLs for C56/DL7UTA go to: Falk Weinhold, P.O. Box 43, O-1130, Berlin. QSLs for C56/DL7UBA go to: Roy Hengst, Deulstr. 28, O-1160, Berlin.

EJ, GREAT SALTEE ISLAND (IOTA EU-103). Operators HB9ASZ, HB9AUZ, HB9BFA, HB9DEN and HB9DKO will be active as EJ3GS, from June 3-10. Look for them to be acive on CW, SSB, RTTY and on request, PACTOR. QSL via HB9ASZ.

EJ, GREAT BLASKET ISLAND (IOTA EU-107). The Island Hoppers DX Group will be active from here July 23-26. The call sign will be EJ3HA and activity will be on all bands, SSB and CW. The group plans to be active in the IOTA contest. QSLs will be handled by Declan, EI6FR.

OH0, ALAND ISLAND. This island has attracted many operators lately. Be looking for activity from Leif Lindgren signing SM0FWW/OH0. He will be there May 20-24 and plans to concentrate on 20, 40 and 80 meters. All QSLs will go to WA4JTK. Also, be looking for Heinz, DL9FAZ, on SSB from June 1-12.

OPPS DEPARTMENT! In last week's bulletin we mentioned that Andy, HB9EAS would be active from the city of Triesenberg, Liechtenstein, as HB0/HB9EAS, May 14-16. We interpreted Andy's call sign wrong from the information

received. Andy's call sign was to be HB0/DL8GCL. The call sign of HB9EAS is a PBBS where the information came from. Thanks to Maurice, HB9BLZ, for bringing it to our attention.

HB0, LIECHTENSTEIN. If you missed the activity by Andy, DL8GCL, signing HB0/DL8GCL over the weekend, you will have a second chance to work another group. Remember, the Wiesbaden Amateur Radio Club (DA1WA) will be active as HB0/DA1WA from May 28th thru June 6th. Refer to OPDX.107 for more details.

OZ/DL1AZZ/P, MANDOE ISLAND (IOTA EU-125). Siggi, DL1AZZ will be active from May 22-29. Activity will be on 10-40 meters.

ST0, SOUTHERN SUDAN. John, PA3CXC, continues to be active on some of the WARC bands. This past weekend he was heard on 30 and 17 meters. Check 10102 kHz around 0400 and 1945z or 18073 kHz around 1845z.

T9, BOSNIA-HERCEGOVINA. Many are still unaware about the new prefix change. The following were active this week: T91A (QSL via DJ0QJ), T91ENS, T93M (QSL via DL8OBC), T93T (QSL via 9A2AJ), T94DD, T94IW, T94K (QSL via YU4EKK) and T95X (QSl via YU4XX).

TM6SM, SAINT MARCOUF ISLAND (IOTA EU-081). French operators FE1OGG, FE1ONF, F6DGT, F9LF and FC1SKJ will be active May 19-24. Activity will be on CW (30 kHz from band edge) and SSB (3760, 7060, 14260, 21260 and 28460). QSL via F6DGT.

YI, IRAQ. A few new operators have been showing up lately. Look for DIYA, YI1DZ, to show on 14247 kHz between 0130 to 0330z. Also look for YI1OMR to be active on CW. Check 14013 kHz around 0415z and 21013 kHz around 21013 kHz.

ZS9, WALVIS BAY. ZS9A was active again this past weekend, first on 21352 kHz at 1415z and then moved to RTTY on 21086 kHz around 1600z.

FAX YOUR DX INFORMATION NOW! Faxing is available Monday/Wednesday/Friday from 0430 to 2330z only. The number is 216-237-8208 and operates Group 3 FAX Service Class 2 (EIA/TIA 592) only. Use only the dates and times specified. FAX Service Class 1 (EIA/TIA 578) is availble upon request by leaving a message to the Sysop on BARF-80 BBS. The FAX card is sharing the same phone line as BARF-80 BBS using a data/fax/phone switch.

Excerpts and distribution of The OPDX Bulletin are granted as long as OPDX/BARF80 receive credit. Gene Marshall (genem@cup.hp.com) wrote:

: Anyway, from another Camry owner, I heard everything should be ok below
: 100W. Can anyone add to this or will my car be 'taken out' buy a passing
: ham two-lanes away :)

For anyone interested... I heard from Toyota. Attached is their
statement:

Attachment
2-WAY RADIOS IN TOYOTA VEHICLES

Installation of a 2-way radio in Toyota vehicles should not present
problems under the the following conditions

The transceiver must be type-accepted by the fCC, and not modified
in any way

Maximum output power complies with FCC regulations (100 watts)

All installation and operating instructions provided by Toyota and
the equipment manufacturer must be follow-d closely

The antenna must be installed as far away as possible from all
vehicle electronic control modules (ECM) or other onboard
computer/sensors

The antenna cabling must be routed no closer than 20 cm (7-7/8
inches) to any ECM or other onboard computers/sensors.

Antenna and power cabling must not be routed along side or in
conjunction with the vehicles wire harness It is always
preferable to cross vehicle harness at right angles when possible.
Antenna and antenna cabling should be properly adjusted to obtain
the lowest possible standing wave ratio (SWR)

Note

Toyota repair manuals will be revised in the 1994 model year to
include this information The current "10 watts maximum power"
limitation will be deleted.

It must be emphasized that, under the terms of Toyota's new vehicle
warranty, any damage caused by RF energy from a higher power mobile radio
is specifically excluded from coverage because it is not the result of
faulty materials or workmanship Accordingly, all such responsibility is
assumed by the owner

>73's
>Ed W1AAZ

All this theory is nice, but my G5RV has an SWR of less than 6:1 on all
the bands it was advertised for. I use a tuner, getting SWR of 1:1 where-
ever I want to use it. I consistantly get good reports on 75 and 40 meters,
(5-9 in Japan on 75m on 5-16-93) I've worked all continents on 20m, It will
tune to 1:1 on 17m, and I've worked Europe and Japan on both 15 and 10m.
If you put the thing up high enough and straight enough, it works. You may
not want to call it an antenna so you don't miff the purists, but it works
and it works just fine.

I use 100-140 watts, because I don't need any more.

Just MY opinion,
Galen Watts, KF0YJ

Ignacy-

I agree with you to an extent. I recall that there was an antenna on the market a few years ago, that had specs that were too good to be true. It was later found to have a resistor inside the matching network, that limited the maximum impedance. Is there by any chance a "mysterious" matching network on the G5RV?

2719. RE: Ramsey SCA Kit and pro-2004

Newsgroup: rec.radio.amateur.misc
Date: 1993-05-17 23:27:32 UTC
From: dwilson@s850.mwc.EDU
Message-ID: <9305172323.AA16695@ucsd.edu>
Source record: 281372

The proper place to tap the PRO-2004 for SCA happens to be test point TP3
which is near the center of the main (LINEAR) PC board.

On the PRO-2005/6, it is test point TP1 which is under the smaller
covered enclosure parallel to connector CN1. (The 2004 test point is
not under a cover however.).

In both cases, tape the test point via a low (.01 uf will do) capacitor
but I suspect the Ramsey unit already has one.

Not sure about Canadian law but in the US, non-authorized SCA listening
is explicitly forbidden by the ECPA.

>does not show this, there is a problem with MININEC or its G5RV file.
>Observation has priority over theory!

The SWR as measured at the transmitter will be less than 3:1 *because* of
the resistive losses in the coax. So although the SWR seems reasonable,
it's only because you are heating the coax feed line. G5RV has stated that
the antenna is 3/2 wavelength antenna on 20 meters and a random length wire
on all other bands. No amount of open wire feeder or coax or combination
can yield a good match across all bands without a tuner. To get a true
indication of the antennas operation, measure the SWR at the antenna and at
the open wire to coax junction. Don't be suprised if you can't get an
accurate measurement as most SWR meters won't handle the high SWR you are
likely to find.

: Throughput degrades. We all lose. The solution is for ALL antennas
: to be high, and transmitters running 20 watts minimum. (easy for me,
: I'm rich).

You don't have to be rich to afford a decent antenna. I recently built a j-pole out of copper pipe, and it cost me less than $20 _including_ the tubing cutter (I already had a propane torch). The "mount" is currently just having the "tail" stuck down one of the vent pipes on the roof. In my area, I don't have to worry about antenna restrictions, but even if I did, this antenna, with maybe a little paint, would be easy enough to hide in a tree or something.

Admittedly, the 20 watts would be a bit more expensive. I'm currently using 5W out of my HT, but will go to about 10 when I get the proper xtals for the old HW-202.

|> synthesize ham freqs from the chip level? WHY? WHY? WHY?

If you look at the bands that these radios cover when they are modified, most
of the bandwith is used for commercial interests. For example, my Yaesu FT-26
Will receive 130-174 MHz out of the box and can be modified to transmit over that
range. This frequency range includes the VHF-Hi band for commercial and public
services. The radio will also to odd repeater splits and has an option for PL
encode and decode. Set it up right, and you have a great whiz-bang commercial
radio. Although this is not always true, oftentimes you can get a commercial
radio from one of the big three (Icom in particular) that looks exactly like
one of their ham transceivers, both inside and out, and is type accepted for
commercial operation. For example, one of my friends back home has the com-
mercial version of the Icom W2A. It has the same frequency coverage that you
can get out of a modified W2A. The only difference is that the programming of
the microprocessor is different.

By doing this, manufactureres save on engineering costs, because they get essen-
tially two different radios for two different markets out of one design.

On Sunday evenings after midnight, all the Dallas tv stations
seem to simultaneously go off the air (at least 13 an above).

I noted last night (the 16th) to my suprise about 2 am I turned on the
set and got snowy but watchable pictures on Channel 39.
Now, since I live about 60 miles from the DFW transmitter
hill to the N.E (town named Greenville)
and since I refuse to pay the local cable co's extorted
rates, I have rabbit ears inside an apartment for pickup.

I was SUPRISED when I found I was looking at KHOU
in Houston! It was pretty stable - would fade out for maybe
a minute and then be back for 5.

The next morning about 6:30 am, I took at look at channel
11, and there was KHOU AGAIN! Strong enough this
time to kick in the color subcarrier detector to give me
a color picture. Not even the DFW channel 11 normally
does this for me.

Question to someone in Houston. Does KHOU have TWO
channels (11 & 39) or would I have been seeing a translator
on 39 from somewhere? Any clue where it might have been?

What voltage do you want out? If you want around 15-18VDC out,
wire the two transformers in series, and treat them as a center-tapped
transformer. Now you just need two power diodes; you don't even need
a bridge.

2729. Recommand 2band HT & mailorder,etc?

Newsgroup: rec.radio.amateur.misc
Date: 1993-05-18 07:11:57 UTC
From: tpang@fraser.sfu.ca
Message-ID: <tpang.737709117@sfu.ca>
Source record: 281438

Hello hams :),

I am thinking about buying a dual-bander 2m/70cm HT, a dual-bander mobile antenna, and/or a dual-band mobile rig, plus a slide-out mount.

Actually I wanted to set up a dual-band system at home, on mobile, and on portable, but I don't want to spend on 3 dual-band rigs, which will be very expensive for me, and redundent in purpose. The mobile operation is the most headache, because there is complication in installation, RFI, etc.

For HT in car op. style:
I want to save money, but running an antenna cable, DC cable, external speaker cable, and hand-mic is no fun, with all the wires running around, and I still need a place to put the HT. Another problem is there is no single dual-band power-amp which will allow true full-duplex op, so I need 2 amps and a band-splitter and 2 antennas (might as well).

So I thought of buying dual-band mobile rig to save all the hassle, but I also want it to be used at home (otherwise , what a waste). So I thought of those slide-out mount. My local Radio-Shack is clearing them out at $5. and only 2 left. These do not have antenna thru-put (at least not RF high-power) so I still have to disconnect the antenna manually. Our local ham store has those with antenna hook-up, don't know how good the connnection is (cause I don't see 50 ohm style connection being used in the junction), but cost $150! (yes, I can buy 30 of the Radio-Shack kind :) On reading the Honda thread worries me, I notice some noise when I listen to my HT with rubber-duck in my car: a Kenwood TH-215.

I have already figured out my portable :) and my home operation, except my computer system (monitor and modem especially) is generating noise on my HT.

So here is the question on the above:
1. What do you recommand?
2. How to limit noise at home?
3. What mobile antenna would you recommand (relatively high-gain dual band)?
4. What kind of antenna to use on my balcony (2nd floor) in my apartment complex, which has a restriction on putting "objects" on the balcony, include antenna?
5. Where is a recommand mail-order place for all these (US ?) ? Since I saw the price is quite high locally, and I am not going to Asia soon :(. I want reliable service, and relatively good pricing.

Which new dual band mobile rig has N-type connector in case I have to disconnect it manually a lot based on above scenerio? (No SO-259 :)?
Which model would you recommand, or brand, from Kenwood, Icom, Yaesu?

(I think I'll only buy these brands, since Standard is not sold locally, and I worried about service, and I don't like Alinco, Azden has no high-end model).

Same question for HT? I have been trying to look for comparison on the Kenwood TH-78A, Icom IC-21AT, Yaesu FT-530. Each has some features which are unique and I want. What is the dual-mic and whisper mode for the Icom 21AT? Are all 3 can get Air-band? How is each sensitivity on out of band receive? like 800MHz band, etc? (because I might save money by not have to buy a scanner :) Also, are all capable of doing packet well?

How do you prevent your Diamond (or some other fancy looking ones) antenna from stolen on your car? My alarm only protects what's inside. Long ago, a friend said one could drill thru the connector area, and put a screw thru it (of course not in the middle :) SHORT!). I prefer a 5/8-2m/70cm because of the gain, but a 1/4 steel-whip might not be as suseptable to being stolen or vandalized. I don't drive very nice car, so I don't think I want to upgrade my alarm to surround sensing ones.

Is it expensive if I want a professional installation in my car? To make sure all the RFI, from the car is not getting in my radio?

Ok, I know this is TONS OF QUESTIONS! I have been doing research and reading and visiting my local ham store, (and going to a local club event soon), plus I am not a new-comer per-se. I am not a take-all-but-no-give either, I post and reply to lots of groups, especially on some computer groups. This is quite a long bandwidth, and I hope it is not too annoying to some.

My last question, (which i posted to .policy,but somehow didn't get thru), is about reciprocal licensing. I'll receive my license by next week, with Advanced class here in Canada, which kind of class will I operate as in the USA (I know it's automatic reciprocal)? How about Hong Kong? Do I need Morse Code for a Hong Kong reciprocal (somebody said I need, but I don't think so)?

E-mail is appreciated, and I'll certainly check this group, all comments are welcome, and if enough post/replies, I'll get a summary out.

Thank you very much in advanced, and for the bandwidth too.

73,

Regards,
David

2730. RFI from ZyXEL modem to 2way radio

Newsgroup: rec.radio.amateur.misc
Date: 1993-05-18 09:08:51 UTC
From: tpang@fraser.sfu.ca
Message-ID: <tpang.737716131@sfu.ca>
Source record: 281440
Cross-posted to: rec.radio.amateur.misc,comp.dcom.modems,sci.electronics

ZyXEL U-1496E is a high-speed external modem, which uses a 68000 uP and
2 DSP chips at 13MHz and 40MHz respectively, inside a plastic case with
no metal/iron RFI shielding. How does it pass FCC as class B?

I am setting up some 2 way radio system near my computer system, a CB
handheld getting power from a power-supply (unfornately, from same wall
outlet to 2 power bars), and a 2 meter (144MHz) handheld now. I am going
to set up more on the 2 meter ham band equipment later.

I am experiencing RFI from both my MAG MV-14S, and my ZyXEL modem, but not
from my Amiga 3000 (by simple isolation test), which makes noise on both
CB and 2m frequencies on the receivers.

I will be doing some mods to my ZyXEL, so I want to know, for convienience
sake, if I could add some metal/iron to shield the ZyXEL plastic case,
internally or externally (ugly :). Is it just e-field to be shielded,
i.e. Aluminum foil is ok. Or magnetic field? which I need iron/steel to
do?

I am cross-posting to 3 groups, since it does cover all areas, and hope
it's not wasting too much bandwidth.

Thanks for any info, e-mail is appreciated, and I'll certainly check
these groups.

Thanks in advanced,

Regards,
David

2731. 171A Tubes; Who Used them?

Newsgroup: rec.radio.amateur.misc
Date: 1993-05-18 09:49:31 UTC
From: P.Lucas@mail.nerc-swindon.ac.UK
Message-ID: <9305180949.AA62834@swmis>
Source record: 281439

warning this message contains discussion of vacuum tubes; neophytes should hit 'n' now!

I was recently given a large number of old tubes to add to my collection; as well as the usual 807's, an 813, and a 304TH (wow, what a bottle!) there were some curious beasties. They are labelled 'WE 171-A', and look like a half-way stage between a traditional 'Acorn' tube (RCA 955 for example) and an Octal-based tube. The glass tube envelope is almost totally contained within the phenolic tube base; there is just a small dome of glass sticking up above the top of the phenolic part.
I guess 'WE' in the designation gives these things as being made by Western Electric, but I am wondering, when were these things made, and what were they used for?
With the phenolic tube-base, the losses must have been higher than the all-glass RCA Acorn-tubes. They look to be a late-1930's design from the style of lettering used on the bases.
Also, has anyone got a spec. on the 171-A? Its not listed in my equivalents charts, but I sure would like to try firing one of these beasties up, maybe a super-regenerative FM-broadcast receiver, with a nice 6L6 for audio output...?

I'm surprised they actually make a coaxial cable. I would have thought
they would just cut slots in a piece of waveguide. Waveguide normally
has the advantage of much lower loss. Page 308 of the 1991 Microwave
update shows how to build one out of WR-75 10 GHz waveguide. I've built
the WR-90 version in the 1989 Microwave update, p 190-191, but don't know
how it works yet... At least one has been used in Texas for mobile 10 GHz
SSB. I also seem to recall Chuck, WB6IGP selling them.

Maybe the 11 meter band could be used as a new packet band! Better
yet, use it as 40 channels of spread spectrum! 10-4 good buddy!

Rick:

I have read that PACTOR is very much better in this respect, and can be used by almost all old rigs. But I cannot verify this because my only experience is with the use of a Kenwood TS-940 that provides very rapid switchover. Perhaps someone on the net, with specific knowledge, can verify this.

2737. Looking for comments on Alinco DJ580

Newsgroup: rec.radio.amateur.misc
Date: 1993-05-18 12:09:54 UTC
From: tbodoh@resdgs1.er.usgs.gov
Message-ID: <1993May18.120954.12244@rsg1.er.usgs.gov>
Source record: 281448

--
Hello,

I'm going for my ticket on Saturday and am looking at the Alinco
DJ-580T. I have several questions and am hoping that someone can offer
some firsthand answers;

o I've sold my scanner, hoping that the HT that I buy can take it's
place - for scanning VHF-HI, AIR, UHF and 800 Mhz. As rated,
the 580 receives 130-174 Mhz and 420-480 Mhz. Alinco sent me the
air band mod - but I've seen references in ads to 800 Mhz
coverage. How is that added? How good is reception in the
extended coverage frequencies - as far as imaging, etc?

o Alinco sent me a note that states "...BUT THE FCC DOES NOT ALLOW
US TO GIVE OUT MODIFICATION INFO ON EXTENDED TX AND RX WITHOUT
VERIFICATION OF M.A.R.S OR C.A.P.S LICENSE.". While (like most
hams) I have no plans on transmitting in these frequencies it
would be beneficial in an emergency. I can understand why the
FCC wouldn't want them to give out the secret, but why does
Alinco go along with the request - is it a requirement written
into their certification for the 580? And do they really mean that
the FCC tells them not to give out extended RECEIVE mods - or does
the same mod open up TX and RX?

o Alinco also states in their letter that transmitting in the
extended ranges may fry the rig. How likely is this? I don't
plan on using it in those ranges, but it would be nice to know -
also can you set a memory channel up so that you can receive but
not transmit?

o How do you like the radio overall?

o Is this HT severe overkill for a newcomer (with 25 years of radio,
electronics and computer experience) or only moderate overkill? ;)

o Have there been any reviews of this radio either in the magazines
or on the net?

I have looked at the ICOM SRA HT, but it's too pricey for me and at that
price should include dual band. Thanks in advance for any help you can
offer a (relative) newcomer...

Hi all,

I have a Motorola MC80 High Band 10 ch. FM mobile, which I want to convert for use on the 2m amateur band. When it was used commercially, the radio operated at about 150Mhz. Does anyone have details of how to go about tuning this radio to 2m ? Can it be tuned to 2m ? Does it need to be modified to operate on 2m ?

Any information at all will be gratefully received.

Thanks in advance.

What is an example of an omni-directional, circularly polarized antenna?
Maybe two antennas, a vertical and a halo, somehow phased? Wouldn't it
change from right-hand to left-hand, depending on from which side you were
looking at the antenna?

>get at the discriminator and modulator is not my idea of fun hobby stuff!

Getting this radio to work 9600 may still not be your idea of a fun time.
The receiver bandwidth will probably have to be opened up to support the
G3RUH-style FSK modems, and to get flat audio down to DC. (Many people
believe that you don't -really- need flat audio down to DC, since there
is a scrambler randomizing the data - but try using an RC to intentionally
distort very-low-frequency audio on a direct FSK modem, and you see a
small but definite bit-error trend).

We did get one of these radios working with a paccom 9600 modem, as part
of a NEDA (north east digital association) link. It took quite a few
hours with some expensive signal analyzers to get it to be reliable. I
suggest pressing the manufacturer of these kits for an "official" mods
list, since the radios already claim to work at 9600-baud.

Standard disclaimer: I have met John Ramsey and his gang ... they are a
great bunch of guys. But I am affiliated with them in no way.

>
>The SWR as measured at the transmitter will be less than 3:1 *because* of
>the resistive losses in the coax. So although the SWR seems reasonable,
>it's only because you are heating the coax feed line.

Let's look at this a little more carefully. At 14 MHz, RG-58 has a loss of 1.7 db per 100 feet, so the coax on the G5RV will have a loss of about 0.8 db. (Roughly 60 feet of coax and 38 feet of open wire line) According to the VSWR chart in the Handbook (pg 16-15), to wind up with less than 3:1 VSWR at the transmitter, the antenna VSWR must be less than 3.8:1 for a cable of this loss. To get less than 3:1 at the transmitter with an antenna VSWR of 100:1, it would require a cable with 4 db of loss, or 6.6 db per 100 foot. Even RG-174 is better than that at 14 MHz.

Coax cable loss is generally low enough at HF that VSWR losses aren't significant. A VSWR of 3:1 only gives an additional 0.4 db of loss for RG-58 over it's nominal 0.7 db per 50 foot matched case loss. A VSWR of 20 only gives an additional loss of 3.8 db. That's noticable, but since most people use far more power than is required at HF, it's probably not significant. If you start with RG-8, 0.3 db for 50 feet at 14 MHz, then even a 20:1 VSWR only gives an additional loss of 2.5 db, and a 3:1 VSWR only results in an additional loss of 0.23 db. That's nothing to be concerned about.

>>does not show this, there is a problem with MININEC or its G5RV file.
>>Observation has priority over theory!
>>Ignacy Misztal Ham radio: NO9E, SP8FWB Internet: ignacy@uiuc.edu

No the problem is not with MININEC. I just used this modeling program to get specific details. The principles involved are well documented. With high SWR the coax absorbs the reflected power, in effect masks the true SWR. The real issue here is that this lost power never gets radiated.

If your issue is whether or not a center fed randon length wire has extreme feed point impdeances (resulting in very high SWR to a 50 ohm system), just look at any antenna handbook.

If your issue is whether or not these extreme SWR's in combination with coax rob you of power look at the graphs on this subject in the transmission line chapter of the ARRL handbook. One shows loss of various coax per 100' when used in a matched 50 ohm system, another the additional loss that gets added due to SWR (this graph only covers conditions up to 20:1 SWR), and another the effect of masking the true SWR due to feed line loss.

So a simple SWR measurement (observation) at the transmitter end of the coax will be erronous.

>>and it works just fine.

>>I use 100-140 watts, because I don't need any more.

>>Just MY opinion,
>>Galen Watts, KF0YJ

First of all your not measuring the SWR in the right place. Look at the graph in the transmission line chapter of the ARRL handbook which clearly shows the effect hidden SWR due to relections being absorbed by high loss transmission lines.

Given a situation like the G5RV presents, all your doing by matching at this point is pulling more power out of your transmitter to be absorbed by the transmission line.

Welcome to the world of QRP where you can work the world with 5 watts or less, even 5 band DXCC! I worked over 100 different countries with a 2 watt homebrew transceiver on 20M in a couple of months (used a 68' end fed wire, L network and no transmission line).

The point is why put up and use an antenna thats not very efficient. A 102' center fed antenna using open wire feeders (ladder line) would make your signal 1 to 2 S units stonger in multiband use.

scary?

don't know why. it would probably be a good thing to get reasonably good communications grade equipment out in the public view for them to see. maybe even some stores will set up receive only installations to allow people to hear real shortwave radio instead of those table top units that might pick up something other than the AM/FM broadcast bands on a great day....

maybe there's a Drake TR-8 in the future too.

and for the pro-code people out there -- how come there's never anything about the "goodness" of learning code in all those 49 MHz radios that have such blatant code keys on them? There's a missed positive opportunity there, gentlemen. [some now are shaped like cell radiophones w/o a code key..]

Bill (who remembers it used to be Allied Radio Shack for a time...and they did have SW and amateur comm receivers in stock...) wb9ivr

For my birthday, I got the yuppie toy, a cell phone.
So I needed an external antenna. (didn't want all that high-
energy RF right by my head, yuk yuk) Got the thing today.
it has RG 174 cable; tiny stuff. What's the impedance?

Also ... the stick is shorter than the typical sign
of yuppiness you see attached to so many windows on the freeway.
It looks like it might be 800MHz 1/4 wave, while the usual thing
is (looks like) 5/8 wave. Anyone reckon it makes a difference?
(after all, DX isn't the intent here) But I'm curious.

>Ed W1AAZ

Ed, Bill Orr, W6SAI, disagrees with you. Take a look at his actual SWR measurements in his article in CQ magazine, Nov. '92. The SWRs are not at all bad on half of the bands. In my opinion, the reason for some bad G5RV reports is that few people seem to realize that, unlike the dipole, the G5RV has almost no broad-side radiation above 20M. The 4 nodes are at 2, 4, 8, & 10 o'clock and I had no luck at all with my G5RV until I oriented it correctly...then it covered the world...Cecil...KG7BK

Here is an example of a use for circular polarization:

In Chicago, two of the world's tallest buildings are about a mile apart. TV and radio antennas are on both the Sears Tower and the Hancock Building. Reflections from these buildings lead to some wicked ghosting in some areas. WBBM-TV (CBS, Channel 2) now transmits a circularly polarized signal from the Hancock building. When the signal reflects off the Sears Tower, the sense of the polarization reverses (eg., looking from the north, where I live, the original signal is CW and the reflection is CCW).

If you receive this with a circularly polarized antenna (horizontally and vertically polarized antennas 90 deg out of phase and summed), one sense will have 2x magnitude and the other sense will cancel. By adjusting the phase delay (lead or lag) you can enhance the signal and kill the ghost.

If all the TV stations in Chicago would transmit with circular
polarization, I might go to the trouble of setting a system like this up.

My thanks to Dave Poole at Zebra Technologies who performed the experiments
to determine this for WBBM.

Hello,

My background is in computers - hardware and software and recently I've become interested in amateur radio. What I intend to do is build a system that will link two PC compatables over a short range (less than a mile). The software side posses no problem - I can sort out a suitable protocol and I can program the interfaces. On the hardware side I know how to build FSK encoders and decoders.

My real problem is with the radio link. Have you ever done something similar ? Can you recomend some decent books ? What about government restrictions (UK only) ? If you can help or if you're interested in this sort of stuff then please mail me. I look forward to your reply.

Sirraj (sirraj@dcs.warwick.ac.uk)

>DX station.

A "cousin" to the multi-band G5RV is the multi-band 1/4 wave trap vertical or otherwise known as an "outdoor dummy load". People (include me) put these things up, ground mounted, over normal soil with only a short ground rod (no radials) and proceed to "work the world". They may be convinced that it is working great. Later they find out that over 1/2 of their transmitter power is heating up the ground!! Still they work all kinds of stuff and probably get lots and lots of 59 reports. So what? The antenna is still extremely inefficient. The only reason it appears to work may be band conditions or simply the other guy's ability to pull you out of the mud. If you have good propagation, almost any antenna will work to some degree.

Now, when you take a poor antenna such as this ground mounted vertical and configure it correctly with a proper ground system under it (100 1/4 wave radials) then it will *really* start to play and the difference is like night and day. The same theory applies to wire antennas like the G5RV.

The bottom line is put up whatever antenna your property/budget will allow, but just because you can work stuff does not necessarily mean it is working 100% correctly.

>
>And are probably for unbalanced 50 ohm circuits...Greg

True, although a balun could be used.

As a follow up I checked out Walter Maxwell's "Reflections" and he describes the G5RV antenna in some detail. His conclusion is similar, that the high SWR into lossy coax gives the impression of a good match when in fact no such match exists. He recommends using open wire line and a tuner and treating the antenna as a random wire.

Either the theory or the evidence is wrong. If you believe that the experience is correct, please provide conclusive measured repeatable results that refute the theory, and explain those results. Anecdotal performance reports about working the world is hardly evidence that something works as advertised. Particularly when transmission line theory and propogation theory would predict that working the world is possible with the G5RV antenna under good propogation conditions. But don't suggest that the antenna is a good performer simply because of a 59 report from a DX station.

Don't know what a vertical and a halo would give you, but there are several
omni-directional circularly polarized antennas. The most common ones in
amateur use are crossed dipoles fed 90 degrees out of phase, the
quadrifilar helix (not the axial mode helix that looks like a spring), and
the turnstile. They all produce circularly polarized nearly
omni-directional signals. (Actually they mostly produce cardioid patterns
which will give omni-directional coverage if aimed towards the sky.)

The question I have is how do TV stations produce horizontal polarization
when their antennas look like verticals?

I agree with Ed, and I believe Mininec. Once the power gets to the
radiator of the G5RV it radiates much like any other dipole - its
success or failure depends as much on its surroundings as anything else.
(trees, proximity to earth, etc.) Actually all dipoles are lousy
compared to even the simplest of yagis, so (if the environment
allows) don't spend your money on overpriced G5RVs, antenna tuners,
ann the like, save it for a real antenna and you'll REALLY be amazed
at how your signal will get out.
On the other hand, if you want to get on the air NOW, don't want
to spend the $$, don't have the space or the considerate neighbors, etc.
then some wire antenna is the way to go.
I think the ham world has been fooled into thinking there is something
special about the G5RV. There isn't. Todays rigs will not be happy
with a 2.8:1 SWR so you need a tuner anyway with the G5RV. If you
are going to run with a tuner why not just use a balanced line
(cheapest feedline you can buy today) and the longest wire you can
put up and I guarantee your signal will be as good (or bad) as
the fellow with the G5RV. And you can run it on ANY band to boot.

There is one which is fairly good at omni-directional circular - but I can't remember the name of it at the moment :-(

Basically you have an arrangement of dipoles in a circle, with all dipoles sloped at 45 degrees. The dipoles are all effectively on the surface of a cylinder (a picture would describe this a lot better!)

To understand how it works, you need to look at the cylinder from the side, where you will see the nearest dipole leaning at 45 degrees. Now, the dipole on the far side of the cylinder is leaning at 45 degrees the other way (as viewed from your side), thus forming an 'X' with the one nearrest you. With suitable phasing, this pair of dipoles can therefore produce circular polarisation. As you walk round the cylinder, you will again see a pair of dipoles in an 'X', so you must be radiating something reasonably circular in that direction as well.....

No idea how well it actually works, I just saw it in a book once!

Dave

A small (<< 1 wavelength) horizontal loop is omnidirectional in the
horizontal plane with the same phase in all directions. If you feed
it 90 degrees out of phase with the vertical, and with the right
amplitude ratio, you would get circular polarization.

Yes, they are roughly omni-directional and circularly polarized, but
NOT circularly polarized in all directions :=)

For example, a turnstile antenna (crossed dipoles fed 90 degrees out
of phase) placed horizontally is circularly polarized in the "up"
direction, but linearly polarized toward the horizon.

Since I initially posted, I have gathered the following additional info.

All of Penta Labs tubes are now manufactured in China. I was about to order a set of 572B's from an un-named source and I asked a few questions like "have you had any trouble with them?"

The response was "the tubes are guaranteed for a year and I have not heard of anyone who had a problem getting replacements".

I probed further-Have there been a lot of failure that you know of. "Well, we have replaced some tubes that were D.O. A., apparently problems in shipping, the filaments were broken. we replaced some of them beacise they were insured by UPS."

His response was such that I didn't feel comfortable in ordering yet. I'm still wondering if anyone out there has had any experience with them recently.

Greetings -

I too have modified the Sears Road-talker CB rigs for 10 and 6 meters.
It was an inexpensive way to get a reasonable low-power six meter rig
using the existing crystals and the 'sum' mixing product instead of
the 'difference'.

The output was limited to about 2 watts on 6-meters. I replaced the
rotary freq-select switch and installed a small multi-line DIP switch
to set the frequency.

50 ohms. A 100 foot length of it makes a pretty good dummy load.
My book says the loss is 30 db/hundred feet at 1000MHz.

> Also ... the stick is shorter than the typical sign
> of yuppiness you see attached to so many windows on the freeway.
> It looks like it might be 800MHz 1/4 wave, while the usual thing
> is (looks like) 5/8 wave. Anyone reckon it makes a difference?
> (after all, DX isn't the intent here) But I'm curious.

Probably not. The usual rule of thumb is that 5/8 wave are "superior"
in flat country while 1/4 waves are slightly more suitable in hilly
country. The idea is that the "gain" of a 5/8 wave over a 1/4 wave
is due to a slightly thinner radiation pattern donut. This thinner
donut means that the 5/8 wave is relatively less able to stand being
mispointed by you going up and down hills than the 1/4 wave is.
Suspect hills are not much of a problem in Houston.

So much for my 2c worth.

I'm trying to locate an antenna mount with the following attributes
(if such a beast exists - I'm asking for a lot):

For use with ATV transmitters around 430 MHz

Is *not* a mag-mount

Can be moved from car to car within minutes

Does not require drilling holes

Can attach to areas like trunk lips or hatch-backs

Any suggestions?

>>>Galen Watts, KF0YJ
>
>First of all your not measuring the SWR in the right place. Look at the graph
>in the transmission line chapter of the ARRL handbook which clearly shows the
>effect hidden SWR due to relections being absorbed by high loss transmission
>lines.

I didn't say where I measured the SWR. I have about 20 feet of RG-8 from the
balun to the output of the tuner. This presents a loss of about 0.25 dB at
30 MHz, 0.07 dB at 3.5 MHz. Using the 6:1 SWR I measured at 3.5 MHz AT THE
ANTENNA, this gives an additional loss of about 0.3 dB due to standing waves.
Total loss is 0.37 dB.

>Given a situation like the G5RV presents, all your doing by matching at this
>point is pulling more power out of your transmitter to be absorbed by the
>transmission line.

Given a total loss of 0.37 dB, if my VSWR at the TX is 2:1, this gives a
VSWR at the antenna of 2.2:1, see fig 24, Ch 16 ARRL handbook.
If I feed 100 watts into the antenna tuner, I lose about 9 watts in the
feedline. If I put more power, the same ratio of input to loss occurs, so
when I match using the tuner, the power increase doesn't all go into loss,
only 9% of the additional power is lost.

>The point is why put up and use an antenna thats not very efficient. A 102'
>center fed antenna using open wire feeders (ladder line) would make your signal
>1 to 2 S units stonger in multiband use.
>73's
>Ed W1AAZ

Yeah, and I have to worry about the open line presenting high voltages
to innocent bystanders, passing the open line into my shack......

What I have works. I think I got my money's worth, and I enjoy using it.

It really makes me sad when people decide that some piece of equipment
doesn't meet their standards and they proceed to tell everybody that it's
junk when a lot of people get good or better results with it. It's come
to the point where everything is a big competition and nobody has any fun.
I thought it was AMATEUR radio.

I have better things to do,
Galen Watts, KF0YJ.

Perhaps we could suggest to the CB'ers that they buy the cellular bands -
think how secure their conversations would be - with their privacy ensured
by legislation!

I'm looking for the phone number and/or address for Fox Tango Corp. I understand that they sell parts and accessories for Heath equipment..... Like an upgrade kit for the SB104A front end and a 400 Hz CW filter for same. I thought they might have adds in QST, but I could find none in the last 15 months.

```
-- MONTHLY REVIEW OF SOLAR AND GEOPHYSICAL ACTIVITY --
Summary for April 1993

Report compiled by the
Solar Terrestrial Dispatch
P.O. Box 357
Stirling, Alberta
T0K 2E0, Canada

Data Provided In-Part Courtesy of the
Space Environment Services Center, NOAA
and the
NRC / Dominion Radio Astrophysical Observatory
Penticton, British Columbia, Canada

MONTHLY ACTIVITY SUMMARY FOR APRIL 1993

We are now in month 80 of solar cycle 22 (as of April 1993). There
were 328 flares (optical and x-ray) in April. This is a drop of 9% over the
number of flares observed in March. Of these 328 flares, 1 was ranked as a
major event and 2 were categorized as minor M-class events.

A breakdown of the energetic events for the last four months follows
below.

_____________________________________________________________
| | APR '93 | MAR '93 | FEB '93 | JAN '93 |
| | --------|---------|---------|---------|
| Major | 1 | 4 | 2 | 0 |
| Minor M-class | 2 | 9 | 16 | 2 |
| Class C or smaller | 328 | 351 | 410 | 163 |
|--------------------|---------|---------|---------|---------|
| Total | 331 | 364 | 428 | 165 |
-------------------------------------------------------------

The monthly sunspot number for April was 98.6 as computed by the
SESC. The preliminary RI international sunspot number for April was 61.9
which results in a smoothed sunspot number of 76.5 for October 1992.

The monthly 10.7 cm solar radio flux for April was 115.9 which
results in a preliminary smoothed mean flux value of 130.5 for October
1992. The monthly mean solar flux adjusted to 1 AU was 105.0.

The largest x-ray flare of April was a class M8.7/1B tenflare from
Region 7477 from N10E55 at 19:15 UT. The flare was associated with major
Type II and Type IV sweeps. A tenflare measuring 680 sfu also occurred,
lasting 11 minutes. The region showed some signs of magnetic restructuring
and growth following the flare, but failed to produce anything more energetic
```

than a small M1.5/SB event at 14:11 UT on 22 April shortly after crossing the central meridian. This region was the major center of activity during the month of April, producing a total of 66 flares (or 20% of all the flares observed on the disk during April).

The list of minor M-class or greater flares and associated radio emissions observed during April follows:

SUMMARY OF MAJOR ENERGETIC EVENTS

Date	Begin	Max	End	Xray	Op	Region	Locn	2695 MHz	8800 MHz	15.4 GHz
18 Apr:	1902	1915	1921	M8.7	1B	7477	N10E55	680	1200	1500

SUMMARY OF MINOR M-CLASS EVENTS

Date	Begin	Max	End	Xray	Op	Region	Locn	2695 MHz	8800 MHz	15.4 GHz
06 Apr:	2343	2346	2352	M1.5		52	83	80		
22 Apr:	1404	1411	1417	M1.5	SB	7477	N11E04	97	430	450

The geomagnetic field in April was less active than observed in March. The estimated planetary A-index for April was 18, compared with 21 in March. This results in an estimated smooth value of 16.4 centered on October 1992, compared with 15.8 for September 1992. There were two sudden magnetic impulses observed during the month. The first occurred at 14:34 UT on 04 April and measured 11 nanoteslas (nT). The others occurred at 06:17 UT on 22 April and measured 12 nT.

The most disturbed day of the month was 05 April following the arrival of a high-speed stream thought to have emanated from an equatorward lobe of the southern polar crown coronal hole. On 05 April, this coronal hole extension protruded to approximately S30 at W25. The estimated planetary A index for 05 April hit 102, which is in the severe-storm category. The GOES spacecraft (both GOES-6 and GOES-7) experienced significant multiple magnetopause crossings. The most serious occurred from about 16:00 UT to 18:00 UT.

It is interesting to note that approximately one solar rotation earlier (27 days earlier on 08 March) a similar disturbance was observed. However, that disturbance had a much stronger sudden impulse of 50 nT and was likely attributed (at least in-part) to the CME associated with the major M7.7/3B tenflare of 06 March. The same southern polar coronal hole extension that existed in April was also apparent in a similar configuration in March. For this reason, the high-speed stream from the coronal hole extension of this earlier disturbance may have been masked and/or enhanced by the flare-shock of 08 March.

Late note: The coronal hole extension noted above dissipated on the next solar rotation, thereby failing to produce another recurrent episode of enhanced activity on 01 and 02 May.

A long-duration C5/1F flare erupted out of Region 7465 (then at S06W52)
at 03:06 UT on 08 April. A 40 minute Type IV sweep accompanied this event
together with a weak proton enhancement at greater than 10 MeV. Protons
never exceeded 1 pfu and decayed to background levels by 10 April. This was
the only proton enhancement observed in April.

The lowest smoothed sunspot number for Cycle 21, RI = 12.3, occurred in
September 1986. The sunspot maximum for this cycle (cycle 22) occurred in
July 1989, with a peak smoothed sunspot number (RI) of 158.1.

Note: Prior to June 1991, the 10.7 cm solar radio flux measurements
originated from the Algonquin Radio Observatory near Ottawa. From June 1991
onward, the flux has been (and will continue to be) measured from the
Dominion Radio Astrophysical Observatory at Penticton, British Columbia,
Canada.

SUMMARY OF AVERAGE SOLAR AND GEOPHYSICAL INDICES FOR APRIL 1993

(Based on SGDB data released by the S.T.D.)

10.7 cm Solar Radio Flux: 115.45
Sunspot Number: 98.63
Boulder A-Index: 14.73
Planetary A-Index: 17.63
Background X-Ray Flux (1-8A): B2.77

Proton Fluence at > 1 MeV: 9.7267e+05
Total (non-averaged) Fluence at > 1 MeV: 2.9180e+07
Proton Fluence at > 10 MeV: 1.2880e+04
Total (non-averaged) Fluence at > 10 MeV: 3.8640e+05

Average Daily Deviation of the Boulder Magnetometer: 27.87 nT

Short Wave Fadouts (SWFs): 0.07
Total Number of SWFs during Interval: 2
SWF Durations: 1.43 minutes
Total Duration of SWFs during Interval: 43 minutes

Average Daily X-Ray Flux: B5.21
Average Neutron Counts: +0.10%
Average Daily PCA: +0.00 dB

Message-ID: <1993May18.205335.14139@newsgate.sps.mot.com>
Source record: 281383

Todd, N9MWB asks:

>The question I have is how do TV stations produce horizontal polarization
>when their antennas look like verticals?

The TV transmitting antennas I've seen up close are merely long lengths of pipe some 18" diameter closed on the top.They have slots cut at strategic positions and as they are horizontal slots hence the horizontal polarisation.

The pipe bolts directly onto the waveguide from the TX.Obviously there is some relationship between size of slot,position of slot and the frequency in use.

All pretty agricultural really but the net effect is just a big stack of dipoles.

Now what I want to know is why they do'nt fill up with water when it rains....

2780. BULLETIN: Monthly Reports & Note to Users of Ionospheric Data

Newsgroup: rec.radio.amateur.misc
Date: 1993-05-18 20:53:46 UTC
From: oler@rho.uleth.CA
Message-ID: <9305182053.AA16238@rho.uleth.ca>
Source record: 281384

/\

ADMINISTRATIVE BULLETIN

18 May, 1993

Note to Users of the Ionospheric Data
Monthly Reports for April Now Available

/\

NOTE TO USERS OF THE IONOSPHERIC DATA

Over the last couple of months, there have been changes to the structure of the daily reports of ionospheric data. We are now providing M(3000)F2, FMIN, Es, foF2, MUF(3000)F2, and TEC data in our daily reports.

At the end of each month, we compile all of the updated and accumulated ionospheric data, and archive the information into monthly archive files. Formerly, we produced an individual TEC report exclusively summarizing ionospheric total electron content. This has changed. The TEC data is now integrated in with the rest of the ionospheric data when the monthly archives are compiled. You can therefore obtain a complete set of values for most of the critical ionospheric parameters in a single monthly archive file.

The daily ionospheric reports are made available for anonymous FTP from: XI.ULETH.CA (IP number 142.66.3.29) in the directory "pub/solar/Iono". Note that the reports in this directory are NOT updated with new data as it becomes available. This may be implemented sometime in the future. However, for now, only the initial daily reports are provided therein. At the end of each month, the files in "pub/solar/Iono" are deleted and the archive file for that month is provided in the directory "pub/solar/1993" under the filenames "iono-xxx.[zip][zoo][tar.Z]", where xxx is replaced with the first three characters of the month (ex. iono-apr.zip).

Those who require full and relatively contiguous ionospheric data are encouraged to use the monthly archive reports as opposed to the initial daily reports. Those who require ionospheric data on a regular timely basis are encouraged to request access to our e-mail distribution list from: Oler@Rho.Uleth.CA, or COler@Solar.Stanford.Edu.

MONTHLY REPORTS FOR APRIL ARE NOW AVAILABLE

The monthly reports for April 1993 are now available through anonymous FTP at the site: "XI.ULETH.CA" (IP number 142.66.3.29) in the directory "pub/solar/1993". The files to grab are:

sgdb-apr.[zip][zoo][tar.Z] - Archive of April Solar & Geophysical Data

iono-apr.[zip][zoo][tar.Z] - Archive of Ionospheric Data for April 1993

aprflr.doc - Monthly Report of Solar Energetic Events

aprrvw.doc - Monthly Review of Solar & Geophysical Activity

** End of Bulletin **

Source record: 281388

I have a 2950.

One warning... the first one from the store was not good...

The transmit audio sucked... no one could understand me. I finally got my home hf rig and sent test messages to myself via tape recorder to check it out... all garbled (I twiddled both the mic gain and power controls to no good). I sent it back and got another one.

The replacement worked fine. I worked New Zealand a couple of times mobile in Texas.

I noticed the ARRL test lab report gave the transmit side a thumbs down (perhaps they got one like mine).

BTW, there are mods to enable "cb mode" which allows receive (and xmit) on 11 meters. The display show CH 19 instead of 27.xxx. I like listening at night, on road trips, when 10 meters is dead.

If I had it to do over again I'd try to find a Uniden (for the same price).

I can't resist this: Not really impossible or even impracticle. Just
restrict it to "only digital" modes with transmitters of _not less than_
say, 500 watts PEP. Methinks that the average CB'er would listen to
packet about as long as the avereage obscene-phone-caller likes to listen
to my land-line modem (BTW, having the modem answer is a great way to stop
a string of obscene or annoyance phonecalls).

If we enforced the above rules for, say, the first 5 or 10 years, I suspect
that most of the CB rigs would get scrapped...

Pete-
Your description reminded me of the WE717A tubes that I have. These have very flattened (doorknob shaped) bulbs mounted on metal shell octal bases. These tubes are pentodes which have characteristics similar to the 6AK5. I have an old Western Electric IF strip with 5 or 6 of these, I think at 60 Mhz. I recall a description of these tubes somewhere in one of the volumes of the MIT Radiation Lab Series, originally published around 1945 or 1948, in 28 volumes. Fortunately, the last volume is a complete index. The Rad Lab Series is a gold mine of information on WWII (now surplus boatanchor) radar equipment and also still valuable theory.

I've seen lot's of discussion of coax loss in this group, and agress with the above statement, but I think an important point is being overlooked. There is also loss in the antenna tuner as well - you don't have infinite Q capacitors and inductors. I suspect that the antenna tuner is probably the greatest source of loss in an untuned antenna system. I know my antenna tuner gets pretty warm sometimes (and I _always_ run barefoot).

>about.

True a low loss coax and high SWR aren't a cause for great concern, but
let's look at specific examples in reference to the claim that the G5RV
has low SWR.

Simply applying a Smith chart to a 102' center fed piece of wire with a
34' piece of 75 ohm twin lead, yields the following terminal impedances:

Band Frequency Antenna Impedance Terminal Impedance

80m 3.7 MHz 36 - j300 1.5 - j50
40m 7.2 MHz 473 + j919 1.5 - j7
15m 21.2 MHz 57 - j90 22 + j16
10m 28.5 MHz 114 - j433 38 + j230

Also from the Smith chart, the SWR on a piece of 50 ohm coax terminated
into the above resistances yields:

Band Frequency Terminal Impedance SWR

80m 3.7 MHz 1.5 - j50 > 40:1
40m 7.2 MHz 1.5 - j7 > 40:1
15m 21.2 MHz 22 + j16 2.6:1
10m 28.5 MHz 38 + j230 > 40:1

So to get an SWR reading of 3:1 or less on 80, 40, and 10, the feedline loss must be about 3 dB, or half the power is going to heat the coax. It may be higher but my Smith chart rapidly goes from an SWR of 40:1 to infinity:1 in a small distance. All of those impedances except the 15 meter one end up very close to the edge of the Smith chart. For those claiming 1.5:1, their feedline losses must be around 7 dB.

Or does the G5RV have some magical property that defies transmission line theory?

73,
Todd
N9MWB

2787. Icom 2410 TX Mod Wanted

Newsgroup: rec.radio.amateur.misc

Re: G5RV Antennae feeds.

After reading some of the discussion regarding Louis Varney, G5RV's antenna design, I thought I'd make a few general comments, based on some articles of his I have read.

The original G5RV was designed by Louis Varney, G5RV as long ago as 1946. It was expected that an antenna tuner would be used between the 80 ohm coaxial feedline (or 72 ohm twin-lead) and the radio.

The G5RV was not designed to be a half wave dipole on it's lowest operating frequency (usually 3.5 Mhz) but instead a 1 1/2 wave centre fed doublet on 14.15 Mhz. The full length of the G5RV antenna top is 102 ft, made from two equal 51 ft lengths.

Instead of simply bringing down a tuned line or ribbon feeder, G5RV arranged there should be a 34 ft matching section of open wire feeder, which had connected to its lower end a length of either 75 ohm twin lead or 80 ohm coaxial cable.

(If 300 ohm twin lead was used for the matching section, it should be cut to 28 ft for the solid variety and 30 ft 7 in for the slotted version, to account for the different velocity factors.)

Unfortunately, the match to the coaxial or twin feeder at its junction with the the lower end of the matching section is only good on 14 Mhz and 24 Mhz. If 50 ohm coax is used, the VSWR on these bands will rise to 1.8:1.

In an article in 1984, Varney described in some detail the different loads presented to a 75 ohm feed line (either coaxial or twin) where it joined with the matching section. Here's a summary:

3.5 Mhz reactive load
7.0 Mhz reactive load
10.0 Mhz reactive load
14.0 Mhz resistive load, approx 90 ohms
18.0 Mhz high-impedance load, slightly reactive
21.0 Mhz high-impedance load, resistive
24.0 Mhz resistive load approx 90/100 ohms
29.0 Mhz high-impedance load, slightly reactive

From the above, it becomes obvious that a tuner should be used between the low impedance feeder (It's obviously even more

mismatched with 50 coax) and the radio.

Towards the end of the description of his antenna, G5RV mentions that the most efficient feeder to use is the open-wire variety, all the way down from the centre of the antenna to the equipment, with a suitable tuner for matching. He added that by using 84 ft of open wire feeder, the system would permit parallel tuning of the tuner on all bands.

If coaxial feeder is used, its weight will pull its centre down considerably, and may alter somewhat the expected radiation patterns.

So as you can see, the feed systems have varied considerably, with the only real constants being the 102 ft length and the half-wave matching section. If you've got the room and a way to bring it in, open-wire feed line is the way to go!

Some of this information came from an article published in our local FM bulletin, and the rest from the excellent RSGB book "Practical Wire Antennas" by John D Heys G3BDQ, which I highly recommend - especially for the non-engineers among us.

There is probably not going to be a discernible difference in the first place.
Make the 10m one about 90% the length of the 11m one, and tune for best SWR,
if you want to be really picky.

From: mcovingt@aisun3.ai.uga.edu
Message-ID: <C79BzH.4LM@athena.cs.uga.edu>
Source record: 281403

Why enable out-of-band transmit?

(1) To work into a transverter (i.e., change the frequency after it comes
out of the HT, typically into a microwave band or something exotic like that).

(1.5) To use the HT as a signal generator for testing purposes.
(E.g., work into a dummy load to test public service receivers.)

(2) Sometimes the ham is a fireman or policeman and would like the ability
to transmit on the fire or police frequency in an emergency. NOT LEGAL except
in bona fide emergencies, because ham equipment is not type accepted for use
in other radio services. Still, the reasoning is, "I own this radio, and
I _may_ need to use it that way, so I should enable it."

(3) Sometimes the ham is _not_ a fireman or policeman, but nonetheless
figures that in a sufficiently serious emergency, he might benefit from
being able to transmit on a fire or police frequency.

But mostly it's the Urge to Tinker.

Does the Pro-2004 get the FM broadcast band?

There is no reason to expect an SCA adapter to work on narrowband FM signals...
in fact there is every reason to assume a subcarrier is _not_ present,
because there isn't the bandwidth for it.

Or am I missing something?

The antenna is an Alford slot. RCA called their stacked array of Alford slots "traveling wave" antennas because of the method they used to feed them. The slots are not horizontal, they are vertical. A vertical slot has the same polarization as a horizontal wire. The slot dimensions are a half wave at the frequency of use. The feed is done by tabs near the center of each slot that is coupled to the center conductor inside the pipe. The stacking spacing is the same as for conventional wire elements. They don't fill with water for two reasons, first there are plastic slot covers, and second there are drain holes at the bottom. Our old RCA had a gain toward the horizon of 13.42 db.

For circular polarization, Jampro and Harris use crossed elements. The Jampro uses Vee elements while the Harris uses L shaped elements. Phasing harnesses feed them such that they generate circular polarization. They are stacked around the support pole so that there are either 3 or 5 major lobes pointing around the clock in the horizontal plane. The feeds are adjusted so that these lobes merge into a nearly constant gain horizontal pattern. These "bays" are then stacked vertically to give the required total antenna gain. Our channel 11 Harris has a measured horizontal variation of only 0.3 db and a total gain toward the horizon of 11.14 db.

The FCC only cares about the amount of power a station radiates in the horizontal plane, in the case of channel 11 that's 316 kw. By going to circular polarization, we can put an equal amount of power in the vertical plane for a total ERP of 632 kw. Circular polarization doesn't suffer the cross polarization losses of horizontal antennas when received on rabbit

ears type set top antennas. So we put a much stronger signal into such sets. On the other hand, since many potential reflectors out in the world are vertically polarized, light poles, water towers, tall buildings, etc, we get more strong reflections now than we did with horizontal polarization. *If* the viewer had a circularly polarized antenna, these ghosts would be suppressed. But since they don't, it isn't such a hot idea. We're pushing more real kilowatts up the pipe, and the viewers are getting more signal, but now it's coming from more directions. We've filled in some previously shadowed areas via reflection, but we've degraded many previously ghost free areas. It's not a clear gain.

Gary

From: dbraun@ilx049.intel.com
Message-ID: <1tcp14$363q@ilx018.intel.com>
Source record: 281408

I ftp'ed myself a copy of MININEC3 (The antenna analysis program) for
PCs. Is there a version of this that runs on Unix? The program
is written in BASIC (ugh), but I don't know if it was originally in FORTRAN,
or if someone has since translated it to FORTRAN or some other language.

Any pointers to a Unix version, or comments on this program in general,
would be greatly appreciated.

murphyed1@woods.ulowell.edu writes:
>Does the ARRL have an internet address??? Is it FTP able?>???

Yes they are on the Internet. The domain is arrl.org. No, you can't directly connect to it because their network provider dynamically assigns addresses from a pool when they connect. (I assume it's a SLIP or PPP phone line from the description they gave me.)

They can do e-mail. They also have a large e-mail information server (info@arrl.org) which can send you all kinds of useful information.

This is all described in the Frequently-Asked Questions (FAQ) articles. The relevant parts are shown below.

--excerpt from Ham Radio FAQ--
Rec.radio.amateur.misc Frequently Asked Questions
Part 2 - Amateur Radio Organizations, Services, and Information Sources
----
[...]
** Where can I find Ham Radio information with a computer?
[...]
* The ARRL e-mail server
ARRL is the American Radio Relay League, representing and promoting Amateur Radio in the USA. They have established an automated file server which responds to information requests via electronic mail. To use the server, send mail to info@arrl.org with any number of one-line commands in your message. Valid commands are as follows:

help sends more detailed instructions about the e-mail server
index sends a list of the files currently available
send file sends a file (replace "file" with the file's name)
several files are referenced by name in parts of this FAQ
quit ends command processing - use it if a signature will be appended to your message

The server program will respond to the commands, each in a separate message. Among many other informative files, a current copy of the FAQ (updated monthly) can be obtained from the ARRL e-mail server.

[...]
** Can I send ARRL or W5YI electronic mail?
Several ARRL HQ staffers can be contacted via the net. Their e-mail addresses are available from the ARRL e-mail file server in the file called "email". See above for more information on the ARRL e-mail server.

ARRL requests that you include your postal address (the slow kind) in
case they need to send you nonelectronic material in answer to your
request.

W5YI, a large VEC, can be reached at the following address:
Fred Maia, W5YI 3511297@mcimail.com

Last week I asked for information about repairing the Heath uMatic Keyer. I would like to thank everyone that sent me mail and I will summarize all the information here

The number for Heath parts is (616)925-5899.

The part number for the 3870 chip is #444-69 and is available for $19.05 and several are in stock.

I was able to bring my keyer back to life by cleaning the pc board.

It certainly would be. I thought this was referring to UHF antennas,
as someone commented that this antenna had a fair amount of gain for
UHF antennas. Then again, maybe my memory has been impaired by too
much CW--or was that too much CW flame wars. :-).

>
> (2) WR-75, etc. is TE10 guide. Which means that the current maxima
> are on the narrow sides of the guide. This is where you would
> want to place the slots for reasonable coupling. But this would

According to the designer of the 10 GHz slot antenna, the coupling
was adjusted for optimum performance by the spacing from the centerline
of the broad wall. The 13.5 dBi of gain on what appeared to be a
professional setup (borrowed from work?) seemed to be pretty decent,
so I built one. The design I built has the slots on the broad wall.

> give you a bidirectional pattern in the H-plane, not the desired
> omni one. I have seen antennas made this way, but they were
> usually unidirectional, with all the slots on one side of the
> guide.

The 10 GHz slot has "wings" to even out the pattern with within 1.5
dB of gain ripple. Supposedly, the pattern gets more lumpy if you
don't use them, though it isn't said how bad it gets.

>
> (3) TE and TM guide has this thing called phase delay which varies,
> sometimes rather a bit near cut-off, with frequency. This might
> produce a frequency-sensitive beam tilt.

This shouldn't be a problem with amateur antennas, unless you are
are going to try using WR-62 on 10.4 GHz. The obvious solution is
to use a guide big enough so you aren't close to cut-off.

I wouldn't have guessed that commercial VHF/UHF broadcasters had a need
for frequency agile antennas like the shortwave types. Though it might
be useful to avoid Tropo and E-skip problems, I don't see the viewers
appreciating this :-) :-). Its rare to get both at the same time.
Tropo tends to be better on UHF, while E-skip tends to be better
in the lower part of the VHF spectrum. For the broadcaster's
point of view, substitute worse for better...

I think this is a pretty neat antenna for amateur microwave use,
particularly if you can find someone to design it for you :-).
After all, what is there to go wrong with a piece of "pipe" with
holes cut into it? Yeah, I suppose you could make the slots in
the wrong place, but these could be patched and placed in some
sort of radome so nobody sees how ugly it really is.

|> --

I have been modifying scanners for years and am convinced that radio manufactueres understand that there is an increased market appeal for those radios that are modifyable. I'm sure Radio Shaft is well aware of the nearly cult following of the PRO-2004/5/6 and I would bet that any follow-on scanner will have things to tinker with. As a secondary benefit - it voids your warantee and makes more income for their repair center especially when some screwdriver jockey decides that he can tune a radio better than they can - simply by trying every screw in sight! Bye...

>callsign administrator.

It'd be more than 6,000 right now...it's probably such that you can be sure
there's enough membership to make sure that the administrator is in the plan
for the long term.

It also appears that there can be more than 1 (expect league to do foot
dragging on this if it looks like there's going to be competition, but then
Wilson might just decide to jump on this ...)

would be superbly ironic if W2NSD were to set up an organization, meet the
requirements and become a callsign admin ahead of the league - but i guess
he's too busy with IMPS and his other music projects right now to do much more
than get the editorials into 73. wonder if W6TNS would be into this?

As somebody else said the other day here, you can get good results with very imperfect antennas. That doesn't mean you shouldn't use them, but it also doesn't mean we shouldn't discuss their shortcomings and try to make them better.

This discussion is a good case in point. If some hams have tuners, and have no problem running open wire into the shack, they will do better running the open wire all the way from the antenna to the tuner, even with a 102' flat top. If they have to (or just want to) run coax into the shack, it'll still work, and will probably work pretty well. It just won't work as well as the open wire.

Almost every ham antenna is a compromise. It's important that we know what compromises we live with. I _don't_ think that article titles like "G5RV: Ripoff" help the learning process (unless we're discussing something like the "Maxcom" device with the dummy load inside).

Now, I'm still just a medical student, so you may not consider this an expert medical opinion, but I would not recommend either of the above activities as being conducive to good health and long life. It is true that low voltages are usually safe on bare intact skin since the resistance of the skin is great enough to prevent a damaging current from flowing. It seems that the safest rule is to work on a circuit with no power applied and after shorting any large capacitors. If you must apply power, then don't wear metal jewelry, use insulated tools, and keep one hand firmly tied behind your back.

From: ham@wam.umd.edu
Message-ID: <1tdfcr$443@cville-srv.wam.umd.edu>
Source record: 281418

I only have one problem with the "Death to CB" thread going on here, and the general distaste for CB. While much of the stuff going on within the 11 meter band is vulgar, obscene, and distasteful, there is also:

1) Truck to truck communications, which make long-distance hauling a considerably easier, more pleasant, and safer proposition for everybody who uses the road.

2) The fact that truckers, who are a major player in the use of 11 meters, use it to help people who are driving cars equipped with CB's.

3) The fact that CB is a cheap, quick-and-dirty way to make emergency communications, and could also be viewed as a resource if one chose to. Notice that you can't get an "emergency 10 meter ham radio kit with collapsible antenna" for $40 anywhere.

4) A way to get into 2-way communications (like ham radio) with very little investment. If a CB was your first radio, raise your hand.

Leave the Citizen's Band alone. We're allowed to use it too!

I monitor channel 9 on my base station CB and the only complaint I have is the great number of people who abuse that channel by using it for their personal communications! It gets so bad that I have to shut my CB off or turn up the squelch so high that I miss most of what I want to hear. Use channel 9 for emergencies and assistance only! The people who abuse CB's are the ones that give the rest of us a bad name.

Just my $.02 worth.

There are two major non-magmount temporary moutings. One is a trunk mount. This is a little metal L that comes off the antenna base that is tightened down around the edge of a trunk lid. You can put nearly any whip on it you like. It also will work an hatch back lids and the rear doors of things like minivans. However, if you put it on a mini-van make sure that you get one that will allow the whip to swivel, otherwise it may end up pointing rearward instead of up.

The other, if your car is equipped with them, is a rain gutter mount. This thing looks like a big paper fastener. You just squeeze it and part goes into the gutter and the other goes against the side of the car.

What do you have against mag mounts?

That's odd, I didn't know Loma Prieta was as far south as San Diego. ;-)

Actually, we did provide several extra channels of communication for bridge
and building inspection here on the peninsula, as well as in the Santa Cruz
area. By far the largest role, however, was handling the H&W traffic into
the peninsula, as AT&T lost its principal fiber trunk (which was on the Bay
Bridge). At Stanford, we were doing H&W traffic nonstop for three days.

Hi fellow neters,

I am a dual hobby kind'a guy. Besides being a Amateur Radio Operator
I'm also a Philatelist (stamp collector in case you didn't know :-)).
So... I was thinking. How could I combine the two? How about being
a QSL manager for a DX'er or expeditioner (sp?)

Then I said "Wait a minute! What am I getting into here?"

So I'm asking you:
1. What are the duties of a QSL manager? How does the process work?
2. Any special skills or facilities needed?
3. What are the expenses of a QSL manager?
4. How does a HAM operator "recruit" his/her QSL manager? Are they
hard to come by or is everyone lining up to be one?
5. How does one "volunteer" for such?

Thanks for the help.

Since the traffic on rec.radio.amateur.misc is pretty heavy, please

>>furthering the amateur service. Its membership must include at
>>least one percent of the amateur operators licensed by the FCC,
>
>So, out of curiosity, how many organizations qualify? That's, what, 5000
>members? I assume there's more than one organization with that many members,
>so this probably isn't a sneaky way of making the ARRL the only special
>callsign administrator.

Actually, you could include:

W5YI-VEC (at LEAST 13000 VE's registered)
10-10 International, with far greater than 5000 in the US
QRP ARCI, maybe?

And maybe a few others? Actually, one percent is like 6,000 now, but
remember that people (like myself, W5YI-VE and ARRL member) can belong
to MORE than one organization.

From: fax%sparc4@Olivetti.COM
Message-ID: <9305191456.AA19576@sparc4.ICO.OLIVETTI.COM>
Source record: 281425

This is the second post of this message because I'm not sure I did the first right so please excuse me for the wasted bandwidth in case you already received it.

Ciao,
I'm considering to buy a beam and some days ago I had the chance to take a look to a Cubex Quad (mod. MK5-PTD3 five bands/3 el) antenna tech specs. Actually, since I always thought to buy a yagi, I never took under serious consideration a quad and I was pretty amazed by the on-the-paper performance. Infacts, its gain is rated 11-13 dbISO, F/B 35-40 db and a very low rotating radius (and that's just great for my QTH).
I'm wondering if any of you guys out there can give me any advice on this ant or, more generally, whether quads work better than yagis under any condition or there is a trade off like more weakness to the wind, etc. etc.

I would also appreciate any comment/suggestion on other makes, or even any kind of ant that can rotate with radius of about 4 meters with a good gain. Height is not a problem since the tower can be almost as high as I want with a minimum of pain.

Gary
--
Gary Coffman KE4ZV | You make it, | gatech!wa4mei!ke4zv!gary
Destructive Testing Systems | we break it. | uunet!rsiatl!ke4zv!gary
534 Shannon Way | Guaranteed! | emory!kd4nc!ke4zv!gary
Lawrenceville, GA 30244 | |

On 20M the G5RV is about as good as a 1/2 wave dipole. Its a 3/2 wave antenna (therefore has a little bit of gain), has a feedpoint impedance (at antenna) of 100 -JXc that results in a VSWR with 50 ohm feedline of 2.8:1 (therefore a little loss when coax is used). Since the little bit of gain is offset by the little bit of loss, why bother (put up the 20M dipole).

The issue here is when the G5RV is used on any other band (where the VSWR's of a 102' center fed wire are nearer 100:1). Even low loss coax in this situation eats up to much power to make the system an efficient antenna.

Message-ID: <C7A7G2.3Au@cbnewsl.cb.att.com>
Source record: 281179

I want to connect a RS HTX 202 to a tnc for packet use. Would someone
who uses one tell me the correct resistor/capacitor values. I have
a cable which has .1 ufd from the audio line to the plug tip and
3.9 k ohm from ptt also to the plug tip. The plug is mono, no ring.
Sleeve is ground. That is the ICOM hookup and it does not key the
HTX 202. Should I be using a different resistor? (eg 2.2k)
I could experiment with resistors and find out what works but everyone
has been saying it's the same as ICOM.
tnx Shel dara@physics.att.com

The problem is, alot of Radio Shacks will sell to anyone. And that's
what caused the demise of 2m in certain areas of the country.

Tony

IMHO.... Amateur radio is a great hobby with many interesting facets.
It lacks, however, a strong political position and the price of new
equipment is higher than it would be if it were massively marketed.

Selling amateur radio equipment and study guides through national chains
like Radio Shack can address both of those concerns.

When the hobby is presented in a mainstream atmosphere it becomes viewed
as a mainstream hobby, not some kind of thing that fat, balding, middle
aged white men do in their basements late at night. When (if) it becomes
viewed as a mainstream hobby then more people will join as responsible
licensed amateur operators. More people == more political clout.

Think back a few years to the 60's when environmentalists were viewed as
"crackpots". Slowly, their numbers grew until they became viewed as a
mainstream group. Today... well, you can't even drain a marsh without
doing an environmental study and every politician is well aware of the
power of the environmentalists. If you have children in elementary
school I'd be willing to bet that they have had at least one environmental
sensitivity project this year. Mine have.... and have done so every
year for several years now.

Hmmm.... Amateur radio was around half a century before the environmental
movement was even thought about, yet we still don't have any political
clout. (Okay, strictly speaking we have SOME political clout, but
possibly not enough to maintain our current allocations in the face of
large amounts of money from commercial concerns. Cripe! it's not

even enough to get the FCC a decent computer system for the license database.)

The second point is rather self serving... I'd really like to be able to do some nifty things on the radio but time prevents me from scrounging or building the equipment myself and finances prevent me from buying it new. I'd really like to see the power of mass marketing drive the prices down and bring the quality up.

You are concerned that mass marketing amateur radio equipment will pollute the airwaves with unlicensed barbarians. I agree. It probably would happen. Cripe! Even with the current state of affairs, the bands are polluted with barbarians, both licenced and not. However, remember this: We used to have severe water and air pollution problems too. But that was before the environmentalists cultivated some political clout. There are still some places that are not complient, it's true, but they are becoming closer to compliance and fewer in numbers.

Oh, a technical note: Radio Shack sales people are taught that they could personally be on legally thin ice if they were to sell amateur radio equipment to unlicensed people. You and I know that it's perfectly legal to sell amateur radio equipment (save possibly amplifiers) to ANYONE, but the RS training program teaches otherwise. I'm pretty sure that no other major amateur radio supplier has the same philosophy.

I work part-time at RS 01-6358 in Center Line, Michigan.

I made a mount to attach to my window. Start with a piece of sheet aluminum or stainless about 1.5"x5", drill a hole for a bulkhead BNC connector, give it a right angle bend and then a u bend to fit over the glass. Seems to work fine. Or, if you want to make the antenna, too, use a BNC/SO-239 adapter and push a piece of brass rod into the SO-239 end.

Every G5RV style antenna I've seen uses either 300 ohm or 450 ohm twin lead.
I don't even recall seeing any 75 ohm open wire line. You might recalculate
with that value.

>Or does the G5RV have some magical property that defies transmission line
>theory?

Well let's see what you come up with with the revised open wire impedance.
I use a tuner with mine, so I don't much care what the VSWR is as long as
the line is low loss. I'd just use a flattop fed with open wire line if
it weren't for the problems of routing the feeder across the yard and into
the shack. I bury the coax. The only real performance loss I note over the
tri-bander the wire antenna replaced is the lack of the steerable null off
the back. Most signals on HF are too strong rather than too weak.

WOW!!! 6 to 12 dB better! Amazing! Never realized you'd get 12dB loss in your coax. (Tongue firmly planted in cheek). An S-unit is supposed to represent 6 dB, or 4 times increase (decrease) in signal. As other posters have pointed out, the losses in the coax do not equal 12dB.

The reason is wind loading. At FM and VHF TV frequencies, a waveguide in
TEM mode would be a yard in diameter instead of 6 1/8 inches. With a
80 foot tall antenna on a 1000 foot tower, that's a lot of moment arm
to have hanging out in the breeze.

>
>Leave the Citizen's Band alone. We're allowed to use it too!
>

Actually Scott you and a great number of people here seem to have grossly misinterpreted what I was advocating:

1) The proposed "buy-back" was to cover from 27.4051-28.0 MHz. This range of frequencies is currently unallocated in the US. That the so-called "Free banders" are using it is of no concern. Legally, there is nothing to prevent the FCC from allocating this slice of spectrum to a legit service, and if they were to allocate it to Amateur Radio it frees them, in essence, from worrying about policing it...since as we all know the FCC seldom if ever gets involved in any actions against those that encroach on the Amateur bands!

Some people have expressed concern over the turf war that such an allocation would cause. I'd bet that MOST (not all) people would abide by the law and not use this range of frequencies if the law were to change. Others have lept to the conclusion that hi-power digital modes in this area would eliminate most interferrence. I too feel that it would make an exellent proving ground for hi-power, hi-speed digital modes in the HF region.

2) I was NOT advocating the wholesale elimination of the legal 11m CB band which occupies the 26.965-27.405 MHz slice. Leave this for truckers and CBers to enjoy, by all means!

What is Radio Shack's position on selling ham equiptment to non-licensees? I am studying for my technician class license right now and would love to purchase their 2m HT that they have on sale so I can save some $$$$ (yes, I know I couldn't use it until I got my license.)

Warren Whitby

Their training manual makes a strong implication that a salesperson could be somehow breaking the law by selling amateur equipment to non licensed people. The correct answer on the test form is to refuse to sell it.

My advice....

Put it in lay-away. That will protect your purchase price and will be a STRONG incentive to complete your studies. If the salesperson is reluctant to sell it to you then perhaps you could get a licensed friend to put it in lay-away for you. Perhaps you'll come across a salesperson that hasn't been through that part of the training or has forgotten the policy.

Good luck with the studies.

>discussing something like the "Maxcom" device with the dummy load
>inside).

QST's review of the Maxcom [spelling?] speaks for itself, but we should be aware that other companies also sell essentially the same technology -- a dipole center-loaded by a resistor -- for commercial/military purposes. Pitched with the proper adjectives, such technology is appropriate technology if it's what the situation/contract calls for.

Think of it: You have operators manning frequency-agile point-to-point communication links. Their mandate allows them to run whatever transmitter power (within limits) they need to effect the necessary microvolts-per-meter field strength in their target area. They also need antenna simplicity and buffering to protect their radios from The Peakiness of Possible External Reality--peakiness like antenna feedpoint impedance, which varies with frequency, height above ground, proximity of other radiators, etc.

So they install a doublet loaded by a high-power resistors. Assuming that incoming signal strengths are sufficient to let their links succeed (the load resistor knocks down received signals, too, but many MF/HF radios are *far* more sensitive than they need to be), it's a golden fix, and entirely appropriate technology.

High efficiency is not *always* desirable; it generally needs tweaking and fussing, drifts in quality over time, and maybe be unrealistically device-specific. Sometimes you just want to get useful communication with minimal hassle--yes, operation under Part 97 too. There's room for folks of every conceivable "energy level" in hamdom.

Can't help with a Unix version as such, but I have seen a Fortran source
before - although I think that might have been the full-blown program and
therefore probably not free. It was several years ago so who knows what has
happened since.

I came in on the end of this thread, but the topic seems to relate
to a problem I am having with my 2m rig in my Nissan Maxima.

The rig is connected directly to the battery with 14 gauge wire.
The antenna is mounted on the trunk lid. I am experiencing
alternator whine, and I have tried everything to get rid of it.
Apparently, it's most prevelant when the rig is receiving.

I have tried shielding the power cables from the rig to the battery.
And I have tried various in-line filters, chokes, etc...No luck.

I have checked for good ground connections of the rig and the antenna.

What gives? Is there something inherent in japaneese cars that
puts out noise that you can't get rid of?

I believe teh regs. were that it was the pilots decision. I am fairly
certain that all airlines have a policy against the use of any receivers
on board. In fact I remember hearing about attempts to make all receivers
and laptop computers illegal to operate on board. I can't give a cite
'cause I heard it on the radio (BCB). All that said I flew back to Mi.
for my mom's wedding last month and I did listen on my '470 but heard very
little. Didn't have the TH78A then.

Good luck,

Excellent point. Most amateur tuners do not specify the insertion loss.
Drake was one of the few that did. Most Drake tuners spec .5 dB.
Assuming other brands are worse, tuner loss can be quite significant.

>to HF.

That's a great question. I always feel a tinge of guilt when I give out a signal report worse than the one I receive since I have a very modest station. Reports on the satellites and VHF/UHF seem to be realistic, but on HF there seems to be a tendency to give 59 if the contact can be completed. This isn't always the case and I've heard ops give consistent 59s with a 52 interspersed but nothing in between. What's the scoop?

Actually, I am ashamed to say that I did construct such a thing as an
engineer at a small, low-power FM station in Atlanta. It was not a good
idea, although the waveguides fabricated from trash cans welded together
were rather ingenious. The difficulty was that the shifts in dimensions
caused by soft breezes were enough to completely change the antenna pattern...

I don't pay much attention to signal reports. Either you work the guy or you don't. I am not about to start making critical antenna adjustments just because I start getting a lot of 5x5 or 5x3 report. Likewise a string of 5x9 reports does not necessarily mean everything is perfect and couldn't be better.

If I get on and fill up a log page in an evening then I say the band must be open and I must be putting out a decent signal. If the log page is empty the the band is dead or my antenna fell down :-)

Has anyone recently ordered anything from these people?

I placed an order for an SCT110 2 meter transmitter the first week in February and still haven't received it. Phone calls to these people are of no help. They keep telling me it should ship next week or two. Their order form says 6-7 weeks for delivery. It has now been 15 weeks.

Is anyone else having trouble with this outfit?

Run out and buy it now. It is a good price. Radio Shack will sell to you, and to anyone else. If they did not, they could be sued for it. There is NO law against selling radio gear to unlicensed individuals.

I STRONGLY encourage people in my ham classes to buy a radio before their license shows up so that they can listen and get used to the style of operating on various local repeaters, and on the HF bands.

A license is only required by law to operate the TRANSMITTER of a rig. So when you buy your HT from RS, look up in the manual for the TX lockout. The rig has an option that can be set to disable the PTT (push to talk) switch, so that you will not accidentally transmit.

By the way, H.R.O. and all the other radio stores will also sell to you even if you do not have a license.

Welcome to the hobby and have LOTS of fun with it!

I hate to reveal my age (and length of time in the hobby) but I can recall seeing Ham Radio gear available in the Sears catalog. As a matter of fact I got a Hallicrafters for my birthday one year. My Mom bought it out of the Sears catalog.

Don't seem to remember it causing Ham Radio to become a General Masses Hobby simply because Sears sold the equipment.

Don't see why we now need to jump down Radio Shack's throat because they are trying to get some of our $$$.

Was in HRO the other day and I didn't see one customer being asked to prove that they were licensed amateur operators prior to buying equipment!

Andre-

I recall seeing a bracket that was mounted on a car's window, and fit into the channel at the top, when the window was closed. One version had a cellular antenna, but I think there was another that had a BNC connector to accept your handheld radio's antenna. This idea may be adaptable to your application.

I have used magnet-mounts, gutter clips and trunk-lid mounts. For me, the magnet mount has been the least damaging to the car, for long-term use. However, any of these methods have potential for some damage.

With the magnet mount, there is potential for damage to the co-ax where it enters the car. If a guest accidentally opens that door, and then closes it without positioning the cable, cable damage can occur.

One thing about a 400 MHz quarter wave magnet-mount antenna: it can be small and light, with the least potential for damage to the car.

Here is data on one such vendor:

E. H. Yost & Company
7344 Tetiva Road
Sauk City, Wisconsin 53583
Telephone (608)643-3194
FAX (608)643-4439

Not only do they have replacement battery packs, but they sell the inserts
so you can rebuild your old ones.

I've seen other companies at the larger hamfests. Another such company is
"TNR - Your Battery Store", located in Altemonte Springs, Florida.
However, I don't have their address handy.

It seems that the amateur radio service had many more active young members and that there was a much greater availability of radio products made in this country and sold in accessible locations before incentive licensing began. This was all a bit before my time, and maybe I've been reading too much of W2NSD's ramblings, but the no-code technician license seems to have turned things around. We are now seeing radios available again in retail outlets, along with an explosive growth in the number of new hams.

As a side note, I took a tour of W1AW last week, and the gentleman giving the tour pointed out that ARRL membership is growing despite the poor economy. He seemed to think that this was related to positive outreach programs of the ARRL. While I am generally an ARRL supporter, it seems like more than coincidence that this growth is related to the influx of new hams with the change in licensing requirements.

Now I realize that a few old timers still think that such things as ham gear widely available in commercial outlets and the no-code technician license signal the end of the amateur radio service (yes, it is defined by the FCC as a service,

not a hobby) as we know it. However, it seems that ham radio in this country was growing old and dying slowly until recently, and I can only look upon signs such as affordable rigs at Radio Shack as a good sign.

Is it true that intermod and spurious signals are a common problem
om multiband handy talkies?
If so, how do some of the newer rigs perform?
Such as Yaesu FT-530, ICOM W21AT, Kenwood TH-78A.

Any information on this subject or others related to 2m/70cm HT
performance would be greatly appreciated.

It sure would be nice to buy the right rig the first time around!

Have any of the magazines done such a review?

A rule of thumb: all other things being equal, a two element quad will perform about the same as a 3 element yag1... although 35-40 db F/B sounds a little high.

The gain figure sounds about right. Generally, a three element yagi will have about 7 dB gain (over a dipole) mfrs like to use the db(isotropic) as a reference simply because it adds 2.15 dB to their number.

The historic problem with quads is not performance, which is generally good, but keeping them up. Their construction is often such that wind and ice seem to alter their physical appearance.

What makes Radio Shack different from any other retailer that sells ham radio gear? As far as I know, there is no requirement that a customer actually have a valid license in order to buy a transmitter. Perhaps as a good faith measure RS will ask to see a license before the purchase, of course, that would cut into their sales.

2876. A Yagi at 11,000 feet

Newsgroup: rec.radio.amateur.misc
Date: 1993-05-20 00:14:29 UTC
From: arthurj@equinox.unr.edu
Message-ID: <1993May20.001429.11199@physics.unr.edu>
Source record: 281205

My friend N7PQO will be spending six weeks at a scientific research site in Greenland. He hopes to take his transceiver and keep in touch with family and friends back here in Reno, NV. Beyond that, he expects to work QSO's aplenty with American hams and probably many others. I'll be his stateside manager for QSL purposes and possibly phone patch traffic if we can get the Danish government to make an exception to the no-third-party-traffic rule.

The scientific station is set up at the very summit of Greenland's ice pack, 11,000 feet above bed rock. The main research there, in fact, is taking a core sample of the ice all the way to the bottom, and making various studies that will lead to a better understanding of climatic conditions going back roughly 200,000 years.

My friend (his name's Mike Savage) and I have been debating what kind of antenna will best serve our purposes. A tower and rotator are probably out of the question. We've been thinking about a multiband vertical like an R5 or R7. However, we have begun to think about a wire Yagi, supported on wooden poles just a few feet above the ice surface, and directed at the west coast of the U.S.

My question for you all to ponder and respond to: Does an antenna located on an 11,000-foot-thick ice shelf "see" the ice surface to an appreciable extent, or does it work like a Yagi (for example) in free space? If the latter is true, it seems Mike could hope to build a many-element wire Yagi for optimized communications with us here in the west, and then maybe use a simpler antenna like a vertical or dipole for casual DX with the rest of the world.

He leaves about June 9. I would be grateful to receive informed opinions in the next few days so we can make our plans on that basis.

Thanks in advance.

Clark, if you pull the bottom cover. Look around and find D5. Its hard to
miss since its the only non smt diode on the board. clip one side and thats
all you need to do. As far as gen coverage, it will do that out of the box.
The mod will let you xmit anywhere. 73 de Don./

All the reports I hear about these MFJ antennas are "not being distributed yet"
Both the vertical and the loop...whats the deal?? Why advertise a product
months before "distribution" This ain't some whiz-bangey software that
needs to be debuged and alpha/beta released to find hardware compatibility.
Are there more instances of this from other companies? Seems to me when I
first see an ad for a rig, it's available. It turns me right off as far as
buying their product (MFJ) and I'm thinking about getting a vertical.
Guess it'll be a GAP or R7.
Flame me if I'm wrong...

Dave, I will allow that there is a place for such lossy matching
devices (although automatic tuners may be a better solution in
many cases). You may recall, though, that the Maxcom people engaged
in such high-jinks as putting a piece of junk surplus printed-circuit
board in their box (complete with assorted ICs) so that anyone going
so far as to dissect the thing would find all that impressive "digital
control circuitry"! What bothered me was the apparent fraud of
implying an active matcher. If they had advertised it as a passive,
resistive device, I wouldn't have minded. (But I still wouldn't have
bought one... :-)

>Every G5RV style antenna I've seen uses either 300 ohm or 450 ohm twin lead.
>I don't even recall seeing any 75 ohm open wire line. You might recalculate
>with that value.

I need to go track down Varney's original an revised writings. I'm finding a bunch of conflicting literature about this antenna and it's not clear if the conflicts were introduced by G5RV or by those describing his designs. The ARRL Antenna book says 75 ohm twin lead, Reflections say open wire feeder, I can't find my copy of the compendium to see what it says, and now you're saying 300 or 450 ohm twin lead. Zack Lau also contacted my because he thought the length was different. Has G5RV ever provided a mathematical description of his antenna?

I'll rerun those calculations but not right now. Too time consuming. I wish I understood Italian so I could use RFC.EXE, sigh.

2888. RFI from ZyXEL modem, please advise

Newsgroup: rec.radio.amateur.misc
Date: 1993-05-20 03:58:43 UTC
From: tpang@fraser.sfu.ca
Message-ID: <tpang.737870323@sfu.ca>
Source record: 281244

ZyXEL U-1496E is a high-speed external modem, which uses a 68000 uP and
2 DSP chips at 13MHz and 40MHz respectively, inside a plastic case with
no metal/iron RFI shielding. How does it pass FCC as class B?

I am setting up some 2 way radio system near my computer system, a CB
handheld getting power from a power-supply (unfornately, from same wall
outlet to 2 power bars), and a 2 meter (144MHz) handheld now. I am going
to set up more on the 2 meter ham band equipment later.

I am experiencing RFI from both my MAG MV-14S, and my ZyXEL modem, but not
from my Amiga 3000 (by simple isolation test), which makes noise on both
CB and 2m frequencies on the receivers.

I will be doing some mods to my ZyXEL, so I want to know, for convienience
sake, if I could add some metal/iron to shield the ZyXEL plastic case,
internally or externally (ugly :). Is it just e-field to be shielded,
i.e. Aluminum foil is ok. Or magnetic field? which I need iron/steel to
do?

Thanks for any info, e-mail is appreciated, and I'll certainly check
this group.

This was posted on comp.dcom.modems a few days ago, for some reason it
did not get to the other groups I intended to cross-post to, such as this
one. I received several e-mail (thank you :) from hams asking me where my
antennas are located, or giving me their RFI results, and some wanted some
answers too.

So far, most said if my antennas are away far enough, then it should be much
better. One reply said it has nothing to do with cables/wires, and it's coming
from the case. (see above). No solutions have been given yet, except turning
it off (but I don't want to).
Thanks in advanced,

Regards,
David

Bought one yesterday here in Silicon Valley. Went into a random Radio Shack on "El Camino Real" and bought their last one. Looks like a nice radio, though I haven't had time to play with it much yet (new job keeps me busy). Also got the extended warrenty (5 years, $40).

People may note with amusement that, even though I have crossposted many mod files from/to packet, the radio I bought has no mods! I have a scanner for out of band reception.

CB wasn't my first experience with radio communications, it was my second after amateur radio. I got a unit for the reasons you list. Outside the cities, and when the skip was dead, it was a useful form of highway communications. But inside the cities it was such a zoo that I switched off. Finally I took it out because it was taking up valuable under dash space for little or no benefit. I don't mind a little swearing, even the redneck wannabes didn't bother me, but the incessant inane chatter got on my nerves. These people didn't have anything to say, they just wanted to chatter. It was like the monkey house at the zoo, or 20 meters on a contest weekend. It's an insult to the intelligence of a moron.

2892. Itinerant radio license

Newsgroup: rec.radio.amateur.misc
Date: 1993-05-20 06:09:19 UTC
From: trasmuss@hertz.elee.calpoly.edu
Message-ID: <1993May20.060919.116844@zeus.calpoly.edu>
Source record: 281198

I have a couple of Motorola VHF HT's that I want to use for miscelaneous business purposes. It is my understanding that there are "itinerant" frequencys that are availble for this type of service. I have a few questions regarding this:

- How does one get an itinerant license? (I know Radio Shack has a form included with their "commercial" VHF HT's. How do you get this form if you already have the radio equipment.)

- How much does the license cost? How long is it good for?

- If I hold a license, does a second person who uses one of my radios to talk to me also need a license?

- What are the conditions/limitations of the itinerant radio service?

-What frequencys are availble for itinerant service. The only one I know is 151.625 MHz. Also I have heard of color "dot" frequenys. Is there any significance to this?

Please e-mail or post your responses.

Dave, this is a feature, not a bug. It tends to limit transmission
time gracefully. Rather than abruptly shutting down the transmitter
with a timeout timer, they allow you to talk until you have to drop
the radio screaming in pain. :-)

Seriously, this is normal. If it happens on the low power battery,
then you might worry that you talk too much.

Yes.

>If so, how do some of the newer rigs perform?
>Such as Yaesu FT-530, ICOM W21AT, Kenwood TH-78A.

Worse, if anything, than the older rigs *without* the wideband receive capability, small size, and low power consumption.

>Any information on this subject or others related to 2m/70cm HT
>performance would be greatly appreciated.

The best dual band amateur HT as far as intermod goes is the Icom 32AT. It's not made anymore of course. As the size is decreased, there's less room for good filters. As the power consumption is decreased, there's less chance of a strong front end. As wide band receive is increased, there's less protection from intermod. As sensitivity is increased, for use with the rubber dummy load, there's more chance for intermod from overload when you put on a real antenna. Etc.

My advice to beginners: GET A REAL RADIO. A HT on your belt isn't a do all device. It's a specialized tool only suited for certain restricted uses. For 99% of amateur use, a good mobile rig is a better deal.

I know, from sales figures, that no one is going to pay attention to this advice. But when you can't reliably hit the repeater, and when the howling intermod drives you mad, remember that I TOLD YOU SO.

>point of view, substitute worse for better...

For TV, the broadcaster wants very consistent performance over the
6 MHz channel. He wants the load to be constant impedance over that
range, and he wants the beam tilt constant in a high gain array.
The coax slot gives that. It's also a piece of cake to field tune
it for ideal pattern. The slot is fed by tabs acting as capacitive
probes on the center conductor. Those tabs have slotted holes for
their retaining bolts to allow custom tuning in place. There are
also slotted tabs at the end of each slot to allow custom frequency
adjustment. It's so easy it's sinful to tune one of these babies
up.

>I think this is a pretty neat antenna for amateur microwave use,
>particularly if you can find someone to design it for you :-).
>After all, what is there to go wrong with a piece of "pipe" with
>holes cut into it? Yeah, I suppose you could make the slots in
>the wrong place, but these could be patched and placed in some
>sort of radome so nobody sees how ugly it really is.

Yep, it's a great antenna. The fact that it acts as it's own support
pole and feedline is also a major plus. There's nothing extra hanging
out in the breeze to generate wind load or to gather ice. We don't
even have to put deicers on them. The power from the transmitter
keeps ice off the slot covers, and the rest of the pole doesn't
matter.

>internally or externally (ugly :). Is it just e-field to be shielded,
>i.e. Aluminum foil is ok. Or magnetic field? which I need iron/steel to
>do?

The usual remedies will work. Conductive sprays on the inside of the
plastic cabinet will help, the GC brand is fine. Shielded cabling will
help. Getting your antennas as far as possible from the device will help.
And as last resort, using 0.1 uf bypasses liberally on the circuit boards
will help.

You're dealing with EM radiation, so either an electric or a magnetic
shield will reduce radiation. Generally it's easier to do electric
field shielding than magnetic field shielding. Aluminum, totally
bonded, should be as effective as steel. Best is a material that
is lossy, such as ferrite, that will both contain and dissipate
the energy fields. The conductive sprays are a mixture of highly
conductive material for shielding, and resistive material for
dissipation. Quite often they are more effective than traditional
highly conducting shielding alone. Remember that shielding depends
on the skin effect. It doesn't have to be thick to be effective.

>rotating radius (and that's just great for my QTH).
>I'm wondering if any of you guys out there can give me any advice on this ant
>or, more generally, whether quads work better than yagis under any condition
>or there is a trade off like more weakness to the wind, etc. etc.

Quads can perform well. After we derate the unrealistic gain figure for the antenna you describe, subtract 2.15 db to get gain over a dipole in free space, we more closely approach reality. A 3 el yagi will have a gain of about 7dbd while this beast is claiming 8.85-11.85 dbd. That still sounds somewhat optimistic. And the F/B claim of 35-40 also sounds optimistic. More likely is the range of 20-25 db. Still, that's not bad.

>I would also appreciate any comment/suggestion on other makes, or even
>any kind of ant that can rotate with radius of about 4 meters with a
>good gain. Height is not a problem since the tower can be almost as high
>as I want with a minimum of pain.

Five bands from a 4 meter boom sounds highly optimistic. With such close spacing, I'd expect the gain and F/B ratio to be less than the stated claim. Note that quads are somewhat less sensitive to Faraday rotation caused cross polarization losses. This can give *apparent* gain increases out of proportion to their calculated gain figures. Their capture area is also often slightly better than a yagi of the same boom spacing, and they tend to be slightly quieter due to a lack of corona points. All this adds up to the conclusion that quads work better than their paper calculations would indicate. So sometimes the manufacturers fudge their numbers a bit.

You're not going to get the performance you'd get with optimum spaced long boom single band stacked yagis, but the performance shouldn't be horrible either. Having the antenna high is a big win, of course. The quad won't be as mechanically reliable as a yagi, though, and climbing that high tower to repair it may be a nuisance.

>what caused the demise of 2m in certain areas of the country.

Nonsense. All major ham radio dealers will sell to anyone. Sears used to carry amateur gear back before the service went into it's incentive licensing decline. That didn't harm amateur radio. Lafayette, Olsen, Allied, and others used to sell to the public without harm. They quit when the service stagnated after 1968. Sears tried a 2 meter rig just before the no code license, but also dropped it because of lack of sales. Now sales are up as our numbers start to grow again, and mass marketers are returning to the fold. My hat's off to RS for taking such bold steps into such a volatile market.

Also got the extended warrenty (5 years, $40).

That would be the "Tandy Service Plan". It's the best $40 you'll spend.
I wish I had something like that when I accidently dropped my two week
old, top-o-the-line $500 icom and snapped off a battery rail. I said it
was a design defect but icom said it was abuse and that it wasn't covered.
A replacement battery for the icom cost half again as much as that TSP.
(In all fairness, after a phone call two letters and several months time,
icom agreed to replace the battery "this time only".)

better deal.

I disagree....

But first, I'll agree....

An HT makes a poor base unit and an even poorer mobile unit. It will
suffer from overload, intermod and the rigors of that kind of service.
I have first hand experience here.... I've been using my HT as a mobile
radio for about a year and a half. I've just bought a real mobile radio
and can't wait to install it. If for no other reason than the convenience
of being able to use it without having to plug it in to the power, antenna
speaker and microphone. Gary is correct.... an HT makes a lousy mobile.

However...

If one were to be able to get only *one* radio then I would advise that
person to get an HT. Even though it is a poor performer in those other
services, it WILL perform. That is to say, you can use an HT for a
mobile, but you can't use a mobile for an HT. Likewise, an HT may make
a poor packet radio, but a 'real' packet radio is pretty useless on
a walk around the block.

I know, from sales figures, that no one is going to pay attention
to this advice. But when you can't reliably hit the repeater, and
when the howling intermod drives you mad, remember that I TOLD YOU

Uh, would you kindly provide the appropriate statute which specifically
states that vendors may not sell amateur gear to non-licensed amateurs.

To the best of my knowledge it is perfectly legal to sell whatever you
want to whomever you want, regardless of licensed status. In fact, even
the "big boys" like HRO routinely sell merchandise to me, even though
I've refused to provide a callsign (I get enough junk mail thank you)
when I've ordered.

Therefore, the correct answer on the test form is to sell it.

I'll put my two cents worth in. Unless the rules have changed drastically
since my last exposure to them (circa 1976), both answers are correct:
it's illegal and the pilot can give you permission.

I believe the way it works is it's illegal but the pilot is the commander
of the aircraft and has the ultimate responsibility for the safety of
the passengers, etc. If the pilot choses to overlook the regulation
which says you can't use your two meter rig (or any other electronic
device) in his plane, then he can do so.

I'd recommend that you don't use your 2M gear on the plane.

|> All the reports I hear about these MFJ antennas are "not being distributed yet"
|> Both the vertical and the loop...whats the deal?? Why advertise a product
|> months before "distribution" (...)

They probably advertise things before they are ready in order to limit the sales of competing merchandise. If you are about ready to go buy an antenna by AEA or Cushcraft when you see a seemingly comparable MFJ antenna for $50 less, then you may well wait to buy that. This is why MFJ will tell you that the antenna is available 'soon'. If they had waited to advertise until the product was ready or even told potential customers about the long wait, they would have lost hundreds of potential customers who would have bought other antennas. They seem to have learned this technique from Apple computer marketing of Macintosh models, by the way (announce a popular product six months before it is available in quantity).

Mine does the same.

I worry that the instruction manual does not say how long it is allowed to stay on 12V high-power Tx.

Recently, my TNC crashed in transmit mode and the HT must have spent at least ten minutes transmitting. It was a long time (>10 min) before I could touch it again. But it seems to have had no ill effects.

>coincidence that this growth is related to the influx of new hams with the
>change in licensing requirements.
>

It doesn't have to be one or the other -- both those things can be true. In fact, most of the ARRL positive outreach programs stress the no-code license as an entry point, I suspect that both things are true. Just changing the licensing terms wouldn't be enough -- the word has to get out about it. But getting the word out without changing the license terms would also have been of limited benefit. Together, they give the growth we're seeing.

The other interesting thing is that in 20 years, these will be the days everyone is nostalgic about. People will tell lies about their TS440's and back in the times when a real ham had to be able to figure out which button kicked in the automatic antenna tuner -- hams were hams and radios had buttons and real honet-to-goodness knobs on them, not some point-and-click software interface....

I have been waiting for the annual spate of "Can I use my walkie-talkie on a plane" postings. Why do I enjoy this? Well like the the "I think I heard a cuckoo" letters to The Times (The real one), it signals the start of spring and summer is just round the corner.

I have used a walkie-talkie from a plane many times. The plane has never crashed. I used to drink with an SM commercial pilot who used his walkie from the flight deck all the time.

The doom mongers will tell you that using a radio from a plane will cause it to come down in flames. Then of course they will tell you that planes cost so much because they have to make everything RFI proof.

Now, many cars are somewhat sensitive to RF, this includes expensive German cars assembled by disinterested Turks. We do get questions about "Can I use my walkie-talkie while driving to work?" The answer to that one is "Maybe" or "Your milage may vary".

2921. REAL Mods for the HTX-202

Newsgroup: rec.radio.amateur.misc
Date: 1993-05-20 15:44:40 UTC
From: fred-mckenzie@ksc.nasa.gov
Message-ID: <fred-mckenzie-200593095733@k4dii.ksc.nasa.gov>
Source record: 281183

No, this isn't an "April First" posting!

You must have noticed that the same basic question, "how do you mod the HTX-202", appears on the net, 3 or 4 times a week. Apparently the HTX-202 was designed to offer high performance for a low price, and to NOT be modifiable for out-of-band operation. (There is at least one such mod that is absolutely bogus, referencing parts that do not exist!) That doesn't mean there can't be other, more practical, enhancements to the radio. This is posting is intended to be the first contribution towards a pool of "mods" for the HTX-202. While it isn't a true modification, I believe it will be of value to HTX-202 owners.

The only weak area I'm aware of, is the battery pack. To get the maximum power from the radio, you must operate it from a cord connected to a separate 13.8 volt power source.

It turns out that the HTX-202 is compatible with Icom battery packs for the old IC-2AT. Some of these packs are available at a higher voltage, and can be rapid-charged from the Icom BC-35 charger. I suggest you get information about this from either Icom dealers, or from battery manufacturers who offer less expensive packs. If someone would research specific battery model numbers, and the resulting radio output power, the information would be a good follow-up posting.

In the event that your original battery pack goes bad, I found one company that offers a refill for it:

HTX-202 Insert $15
7.2 Volt 600 mAH

E. H. Yost & Company
7344 Tetiva Road
Sauk City, Wisconsin 53583
Telephone (608)643-3194
FAX (608)643-4439

This company may also have the higher voltage battery packs.

2923. Re: Timewave DSP-9

Newsgroup: rec.radio.amateur.misc
Date: 1993-05-20 16:03:41 UTC
From: RICK_A._MARTIN.OKLAHOMA_CITY@xerox.COM
Message-ID: <"20-May-93.11:03:41.CDT".*.RICK_A._MARTIN.OKLAHOMA_CITY@Xerox.com>
Source record: 281189

>Does anyone have information on the Timewave DSP-9 or DSP-59 units?

Michael,

I just bought one of the DSP-9 units from Timewave. While I am not an expert and have limited experience to make comparisons, I will give my impressions of the unit.

First, I phone ordered the DSP-9 which arrived by UPS about a week later, which was just what I was told. The construction is solid and has a good "feel". (I have not opened it up to examine the circuit board). Connection is simple; two RCA phono jacks on the rear with the DSP-9 in line between the radio and external speaker.

Operation is simple, set the volume of the radio for a yellow LED to flash during peaks without the red LED coming on, then set the volumn of the DSP-9 to listening level. All options are selected by buttons on the front panel. They select mode (Voice or CW), hetrodyne notch filter, random noise filter, and bandwidth.

I cannont make an adequate comparison to the high dollar DSPs as far as effectiveness, distortion, etc. But, I can tell you that the hetrodyne notch feature is just about worth the price of the unit by itself. When the lids tune-up on top of that rare DX station all I hear is a short chirp when the filter acquires and notches them out. Fidelity is very good in this mode.

The random noise filter does REDUCE the amount of background noise. It does not ELIMINATE it completely. There is some degradation to weak audio signals in this mode. But I have found that the trade off is worth it. When casually monitoring or scanning the bands I leave the filter on and find that it cuts fatigue and stress by reducing the static and hiss. But, on weak DX that may not have great audio to start with, I turn the filter off during the QSO.

The voice bandpass filters all have a lower freq of 300 Hz. The upper cutoffs are; 2.1 kHz, 2.7kHz, and 3.4kHz. I have found these to be adequate for most conditions. Most of the time I run the 3.4kHz. Using the 2.1kHz filter cuts adjacent channel noise but also cuts some of the voice audio. These filters seem to be extremely sharp with steep skirts. Undesired tones drop 60dB at 180Hz outside the filter according to the specs.

The CW mode has a random noise filter also and seems to be more effective in this mode than voice. The bandwidths are; 100 Hz, 200 Hz, and 500 Hz. The center freq is selectable between 600 Hz or 750 Hz. About all I can say is that the steep skirts work well here and I can isolate a single signal in the middle of a busy freq.

A couple of minor negatives: No power supply comes with the unit. It needs 500-800 ma at 12 volts. A wall module unit works fine. It would be *nice* to be able to adjust the 300 Hz lower freq on the bandpass filter. The headphone jack is 1/8 th inch stereo. I would have preferred 1/4 inch.

One final observation: As with any audio filter, it does not stop strong adjacent signals from effecting your AGC. You do notice some noise and signal levels rising and falling.

Those are my impressions, I thought for the price of $149 I got my money's worth, since I no-longer need to buy a CW filter for my TS-820 and I can keep the lids from tuning up in my headset.

Comments heard loud and clear. As I say, the *QST* review speaks for
itself.

Your idea about autotuners is well-taken, esp for hammy applications. But
do consider HF frequency-hopping spread spectrum--one would need a *high-
speed* tuner for that. Resistors, luckily, have sufficiently rapid response
time, and an unlimited number of memories. So I suspect that resistive
antenna broadbanding is of particular value this special application.

2926. Radio question (from a non-ham)

Newsgroup: rec.radio.amateur.misc
Date: 1993-05-20 16:10:16 UTC
From: rboudrie@chpc.org
Message-ID: <1993May20.161016.21439@chpc.org>
Source record: 281190

I am looking for information on portable radios which meet the
following requirements (what to get, where to buy them, how much to
expect to pay, etc.)

- Set of 6-8 handheld, battery operated portable radios for "walkie
talkie" style use. Maximum range used will be about 1/4 mile, but I
would prefer a 1 mile range to have that "extra margin".

- Must be name brand, expandable equipment (ie, assured availability
of being able to buy compatible additional units, even years down
the road)

- Operators will not be ham licensees, but the organization could get
a radio license if needed (but prefer not to).

- Inividually adressable would be nice, but not imperative.

- Prefer something other than CB

- Will be used by non-profit organization in it's events (ie, use would
not fall under the ham "non-commercial" requirement)

- Rechargable necessary; exchangable battery packs a nice bonus.

- Simple operation - user shsould not need to select a frequency, etc.
(or, if they do, it should be easy to leave set). Icon W2A's are
right out :).

- Needs a reasonably loud speaker. Someone should be able to hear
the page over the radio while wearing NRR 29DB earmuffs (use will
be on a shooting range).

Please send info to : rboudrie@chpc.org as I don't generally read this
newsgroup.

thanks,

Rob Boudrie

|> Does anyone know why Icom required me to perform the out-of-band mod on
|> my 24at in order to transmit within the ham band at 439 MHz?

Because the normal FM subband in the 70cm band (in the U.S) goes from 440-450 MHz. 439 MHz is set aside for weak signal work (SSB, CW, satellites, EME), I believe.

Message-ID: <1993May20.163433.25796@peavax.mlo.dec.com>
Source record: 281197

I generally give out 3 signal reports:

59(9) perfect copy
57(9) not strong but I can copy everything
55(9) very weak, but can exchange reports OK

If the DX station is working them fast, and giving out 59's to
everyone, you should do the same. Chances are the DX is going to log
the received report as 59(9) anyway, especially if s/he's using
computer logging.

Amateur Radio stores will also sell to anyone. I have never been asked for
my license when purchasing radios, etc. I was asked if I knew that I needed
a license to use the equipment. That is what Radio Shack needs to express
to their employees. The only way around it would be a law requiring display
of a license prior to purchase. Kind of like buying Freon in Calif. BTW, I
would be opposed to such a law.

To overt the demise of 2 meters, these individuals need to be found and
educated about ham radio. For example, I heard someone using the call
KD6A1C. Yes thats Kilo-Delta-Six-Alpha-ONE-Charlie. I became suspecious
while another ham told him that his call was probably KD6AIC. I looked up
that call and I doubt if his name is Susan.
Part 97, learn it, live it, be it, teach it. If you can't, then don't be
a ham.

A little while back there was some discussion of one or two models of new spread spectrum telephones operating in the 902-928 MHz region. I seem to remember some reports on construction, performance and audio quality. These were, perhaps, non-type-accepted units obtained off shore. One of the brands may have been Panasonic or Sony.

Can anyone direct me to any details of these units and/or tell me where I might get my hands on one?

I'm interested for a number of reasons, not the least of which is what kind of interference these things might present to our 904 MHz 256 Kbps backbone here in Northern California.

Thanks for any leads or help.

genew@techbook.techbook.com (Gene Wolford) writes:
:
: Is it true that intermod and spurious signals are a common problem
: om multiband handy talkies?
: If so, how do some of the newer rigs perform?
: Such as Yaesu FT-530, ICOM W21AT, Kenwood TH-78A.
As Gary said many ofthe newer rigs are worse because of the out of band
stuff. I haven't played with the TH78A with an outdoor antenna enough to
really judge it. Plus I live in a cow town and there isn't too much
trouble anyway. Well there is the UC paging system that frys my friend's
FT-530. If you want to get a newer dual bander that does well with
intermod try the FT-470. I have one and have used along side both te
DJ-580 and FT-530 it seems to do much better thaneither of these two
radios. The only time I ever had a problem was when it was sitting
within 8" of an old bearcat scanner. No problem at 12" though. The '470
isn't DC-Daylight though. It will open up to lock on almost sny
frequency you like but it is as deaf as a doorknob out side the ham and
pub-service freqs. Another advantage to the '470 is the fact that with
the '530 out the prices seem to be going down.

: Any information on this subject or others related to 2m/70cm HT
: performance would be greatly appreciated.
: It sure would be nice to buy the right rig the first time around!

Another option may be to go out and buy the Radio Shaft HTX-202 while it's
on sale and then get the 70cm when it becomes available.

I have the W9GR DSP audio filter that was in QST. Nice!

I solved the distortion and masking of weak signals (low audio levels) by
putting an audio automatic level control circuit in the input side of the DSP
filter. This brings up weak audio so the DSP can get full range on its analog
to digital converter. It also prevents a sudden loud signal from overdriving
the DSP (which really sounds terrible).

This ALC (compandor) circuit was in the Feb 1993 issue of Electronics Now
Magazine (formerly Popular Electronics?). The author is Steve Szabo, N1AYO.

He offers the circuit board and parts as a kit or assembled. I think the
assembled version was about $30 bucks. The parts only version was cheaper. It
is only about 2.25 inches on a side. If anyone needs the details drop me some
email.

If you are interested in the W9GR DSP, drop him a note at

Date/time : 15-Feb 01:09
Title : * * * HTX-202 * * * DISPLAY MOD/FEAT

Hello to all HTX-202 users from KB9FAI Montello Wi. .

Yes beleive it or not I found an UNPUBLISHED mod for the HTX-202 and will be forwarding this to R.S. , etc.

I was looking at the Alinco DJ-580, the salesperson pointed out a lock feature on the display/keyboard to illuminate the rig for mobile operation. I wish my rig(202) did that. would be nice in the truck.....

So on Feb. 7 / 93 while listening to a local net I was playing around with it. This mod/feature will cause the display to remain ON rather than shutting off after the 5 second light delay. Mine has now been on 2 hr. and the display is only a little warm.

Do the following :
1) Press the F key (uper left side above PTT)
2) While holding this key in press the L key (under PTT)
3) Thats all ! Enjoy your radio in the dark !

Hope this little option/feature helps all of you that wanted an illuminated HTX-202 ! I know I will enjoy mine ALOT more !!!

You are all very welcome, 73's de KB9FAI, Randy Mueller
Send any replies via packet to WB9ZRE @ RIPON WI.
BYE !

Most seem to agree that an HT doesn't make a great mobile, but the complaints about intermod need to be tempered by the fact that not *all* HTs suffer from serious intermod when used with an outside antenna. I've heard many reports that the HTX-202 doesn't have this problem, and I have as yet to hear an intermod problem on my FT-727R when using it mobile with a Diamond NR-770R on a magmount. I've used it in a number of cities on trips and have never heard any intermod problems. On the other hand, the front end isn't wider than a barn door as is the case with many newer HTs. :-) If you want an HT to receive DC to light, don't be suprised if it *always* receives DC to light.

Source record: 281194

I just located my copy of "Practical Wire Antennas" by John Heys G3BDQ (nice book by the way) and he describes the G5RV. Apparently a little history is involved in that G5RV initially made claims that the antenna provided a good match across the bands. Perhaps due to the date of his initial work (1946) the existing PI networks in many transceivers could provide a resonable conjugate match. G5RV then in the July 1984 issue of Radio Communication strongly stressed the need for an ATU between the coax and the transmitter and also gave his findings on the sort of load the antenna provided at various bands. His findings were (from Practical Wire Antennas):

3.5 MHz reactive load
7 MHz reactive load
10 MHz reactive load

14 MHz resistive load, approx 90 ohms
18 Mhz high-impedance load, slightly reactive
21 MHz high-impedance load (resistive)

24 MHz resistive load approx 90/100 ohms
29 MHz high impedance load, slightly reactive

Also the "matching" section was supposed to be open wire feeder 34' long. Other 300-450 ohm balanced feeders could be used, but only by adjusting for velocity factor. Also note that unless a balun of some sorts is used at the coax to balanced feeder, you're likely to get RF radiating from your coax (from Reflections).

So even the inventor says that you're not going to see a good match across the various bands. This isn't to say the antenna isn't any good, but that if you are seeing under 2:1 SWR across the bands, then something is wrong with your antenna system. Low SWR does not necessarily equal good performance.

Also as Gary and several others have noted, if your coax has relatively low loss, i.e. RG-8 in good condition, then a high SWR matched with a conjugate match at the transmitter isn't a big deal. However if your coax has appreciable loss due to damage, crummy coax, water, etc. then you're likely to see a good match even without an antenna tuner, and your performance isn't going to be all that great. Maybe only 58 instead of 59. ;-)

This is what most operators on the CW bands seem to do. I do this too. In
addition:
449 for copy of call and sig report and not much else

339 for copy of just call sign - usually a broken qso

I know that this is not as described in the Handbook. I think
of it as a coarser decription with "fewer bits" of resolution.

I sometimes have my HT in my backpack and let it be x-rayed. No problem. I sometimes have it on my belt, particularly if I talked on the way to the airport or if my carry-on luggage is full, and I just hand it to the guard and switch it on. No problem. I have carried my HT on passenger aircraft about a dozen or 14 times (a round-trip flight counts twice), and have never had any problem, or even a reaction from the security personnel. HT's are a lot less trouble than a laptop :-)

I have never keyed the radio on board the aircraft, though 1/2 :-)

2947. G5RV Theory: Help

Newsgroup: rec.radio.amateur.misc
Date: 1993-05-20 19:20:32 UTC
From: MOSIER@steffi.uncg.EDU
Message-ID: <01GYEFKHYN9E8WW1A5@IRIS.UNCG.EDU>
Source record: 281145

I've been following the G5RV thread hoping (in vain) that someone would work through the theory behind its design. So I tried to understand it myself, based on the design shown in the ARRL Antenna Handbook, namely 102 ft. of dipole center-fed by 34 ft. of 75-ohm twinlead. On 20 meters (what it was designed for), that is a 3/2-wavelength dipole, fed by a half-wavelength of 75-ohm line. So the radiation resistance of the 3rd harmonic dipole is going to be somewhere around 100 to 120 ohms, let's say. But I can't understand why we have a half-wavelength of parallel line. A quarter-wave length of 75-ohm line would transform the impedance from about 110 ohms to roughly 50 ohms, suitable for 50-ohm coax. But you wouldn't really want to terminate a 3/2-wavelength dipole in a quarter-wave section, because the transmission line length (1/4-wave) and one arm of the dipole (3/4-wavelength) together give you exactly two half-wavelengths of line into which you very nicely couple antenna currents, which unbalances your balanced feedline, giving you feedline radiation. So what do you get by extending the feedline another quarter-wave? Do we treat that as a half-wavelength feeder which should result in no transformation of the antenna feedpoint impedance of around 100 ohms? Or do we treat it as a second quarter-wave transformer? That doesn't make sense here either. Either way, the antenna works OK at 20m. Feeding the antenna/half-wave line section with 50 ohm coax gives you a 2:1 SWR. Feeding the antenna/quarter-wave line section with coax, with a quarter-wave 75-ohm section in between, gives you better than a 2:1 SWR. Am I analyzing this correctly? How about some help from you antenna guru's out there.

Question No. 2: The ARRL Handbook says, "A dipole can be used as an all-band radiator by using tuned open-wire feedline." (The familiar Zepp, as the term is used today -- Zepp REALLY refers to the end-fed radiators which trailed behind the Zeppelin airships). But I can find no reason why a coax-fed antenna should not behave identically as an all-band radiator, if one ignores the potential losses due to feeding a lossy cable at high SWR. Is that the reason why we think of a ladder-line antenna as all-band, that the ladder-line exhibits little loss even at high SWR, whereas the coax has more loss? Assuming we properly match the coax at the antenna feedpoint to prevent a radiation current on the outside of the coax, I can't find any other reason (than loss) for using the ladder line. Again, am I looking at this correctly? BTW, the loss factor is a perfectly good reason. I just want to know if that's the ONLY reason. I'm a long-time lover of Zepp antennas.

>>>> phase and produce a fair amount of gain, particularly at UHF.
^^^^^^^^^^^^^^^^^^^
And then, Jim Bromley, W5GYJ writes:

>>A couple of points:
>>
>> (1) Imagine building this thing out of waveguide for VHF-TV channel 7
>> at 174 MHz. Pretty impressive, huh?

In article <1481@arrl.org> zlau@arrl.org (Zack Lau) writes:

>It certainly would be. I thought this was referring to UHF antennas,
>as someone commented that this antenna had a fair amount of gain for
>UHF antennas. Then again, maybe my memory has been impaired by too
>much CW--or was that too much CW flame wars. :-).

Actually, I was over-generalizing and referring to *both* VHF and UHF
TV broadcasting antennas. And Zack, I'm sure you're aware of the
inverse relationship between code speed and IQ. So be careful!

>According to the designer of the 10 GHz slot antenna, the coupling
>was adjusted for optimum performance by the spacing from the centerline
>of the broad wall...

Actually, I never saw the article on the 10 GHz antenna. So, following
long Usenet tradition, I set up a strawman from my fertile imagination
and then proceeded to knock it down.

>I wouldn't have guessed that commercial VHF/UHF broadcasters had a need
>for frequency agile antennas like the shortwave types....

Gary, KE4ZV, addressed this point in detail in a follow-up article.
Getting nice, flat-frequency-response, low VSWR antennas for VHF
TV transmission takes some doing.

>I think this is a pretty neat antenna for amateur microwave use,
>particularly if you can find someone to design it for you :-).
>After all, what is there to go wrong with a piece of "pipe" with
>holes cut into it? Yeah, I suppose you could make the slots in
>the wrong place, but these could be patched and placed in some
>sort of radome so nobody sees how ugly it really is.

IMHO, such an antenna constructed for 10 GHz would involve a fair
amount of precision machining. On the other hand, if one could
make the waveguide out of copper-clad fiberglass and use photolith

techniques to cut the slots, one would have a design that could
be easily duplicated or mass-produced.

2949. SMITH12.ZIP - Hams: Interactive Smith chart calculator

Newsgroup: rec.radio.amateur.misc
Date: 1993-05-20 19:33:54 UTC
From: FONTANA@ITNVAX.CINECA.IT
Message-ID: <9305201933.kp5058@tacom-emh1.army.mil>
Source record: 281213
Cross-posted to: comp.archives.msdos.announce,rec.radio.amateur.misc

I have uploaded to WSMR-SIMTEL20.Army.Mil and OAK.Oakland.Edu:

pd1:<msdos.hamradio>
SMITH12.ZIP Hams: Interactive Smith chart calculator

The program is a Smith chart calculator. It displays on an EGA screen the impedance chart, the admittance chart and the coefficient of reflection chart. An info display and a graphics cursor is used to explore numerically the plane. Elements are entered by the keyboard and the resulting graph is immediately drawn on the chart. Up to two parameters of each element can be trimmed using two individual keys (up and down, upper and lower case). The program offers: hardcopy, frequency sweep, circle drawing, montecarlo analysis, schematic synthesis. A pop-up calculator for complex numbers is also included.

Uploaded by the author.

Source record: 281144

Ed, W1AAZ may have all the technical ducks in a row regarding SWR, losses, etc., but I'll swear by G5RV. Using a TS820s (100W) and a G5RV at 12 feet (now 15 ft) off the ground, I've been able to work every state in the US, each Canadian province, Europe, Asia, South America, Africa, Australia and New Zealand. Of course, I use an antenna tuner, and it may be that I get a lot of feed-line radiation. Whatever, I go by results vs dollars invested. IMO, the G5RV is the best antenna for the price available anywhere.

As an aside: Several years ago when returning from a camping trip to the Great Northwest, the security officer made me remove my flashlight (which was stuffed in my sleeping bag stuffbag) to prove it was a flashlight. It must have looked very suspcious in the monitor. Of course this was at a major international airport (Minniapolis) during some very trying times abroad (1984) so security was very tight.

Starnge they didn't question my 12 pack of Henry's beer in my other carry on tho.

OK.....here they go...

Subj: Ranger 2950 mods

Someone here recently posted a message asking for available mods
for the Ranger RCI-2950 10 meter radio. Here's what I have.

Frequency Modification
1. Remove the case. I *think* you can remove either the top cover
or the bottom cover to get to the PC board with the jumpers.
It will be a small PC board immediately behind the front panel.
2. Locate "J2". There will be a jumper on pins P3 and P4.
3. Remove this jumper to expand coverage to 26 MHz - 29.7 MHz.
4. Move the jumper from P3-P4 to P1-P2 to expand coverage to
26 MHz - 32 MHz.
5. After moving (or removing) the jumper, press the CPU reset button
(located below J2).
NOTE: Operation between 30-32MHz may require retuning the VCO.

CB Channel Readout Modification
1. Locate J1. There will be a jumper on pins P1-P2.
2. Remove jumper and place on P2-P3.
3. Press the LOCK button on the front panel. The readout will now
display the CB channel number 1-40 -- also will display "A" channels.
4. Press LOCK again to return to VFO mode.
NOTE: The SHF button will not operate while in CB mode.
This modification will disable the frequency lock function.

CB Channel 9 Select Modification
1. Locate J3. There is a jumper between P1-P2.
2. Remove the jumper and place it on P2-P3.
3. Press the "roger beep" button to go directly to CB Channel 9.
NOTE: Doing this modification makes it impossible to turn off the
roger beep feature (unless, *possibly* you make sure the

roger beep is turned off before moving the jumper. I'm not
sure).

"Tuneup" Modifications

Adjust VR14 (AMC) for maximum forward modification. Mod limiter
Q32 can be removed for more modulation, but it also disables VR12
(SSB ALC) and disables variable power for SSB. I do not recommend
removing Q32; you'll have plenty of modulation as is.

Tune L34, L13, L14, L46 and L10 in AM mode for maximum forward
swing, using a peak-reading wattmeter. Try to balance for even power
from top to bottom of frequency range.
NOTE: You'll have a LOT of trouble identifying these cans. Sorry,
I don't know for sure where they are either.

Adjust VR13 (AM High Power) for 12 watts dead key with the front
panel RF power control at maximum. Adjust VR15 (AM Low Power) for
2 watts dead key with front panel RF power control at minimum.
From the 12-watt dead key you should see a forward swing of 30-40 watts.
From the 2-watt dead key you should see a forward swing of 18-20 watts.

Adjust VR12 (SSB High Power ALC) for maximum PEP on SSB, then
back off just a little, with front panel RF power control at maximum.
Adjust VR16 (SSB Low Power ALC) for 5-6 watts PEP on SSB with front
panel RF power control at minimum. You should see 40-50 watts PEP
on SSB with front panel RF power control at maximum.

Microphone wiring diagram

Pin 1 -- shield
Pin 2 -- Audio
Pin 3 -- Transmit
Pin 4 -- Receive
Pin 5 -- Frequency select up \ These might be reversed.
Pin 6 -- Frequency select down /

Disclaimer:
The preceding message is posted for information only. I do not
condone the modification of amateur transceivers for use outside the
amateur band. It is *possible* that performing the tune-up
modifications will shorten the life of the radio's components due to
driving them too close to their design tolerances. I accept no
responsibility for possible damage to any radio that is modified in this
way. I cannot personally vouch for any of these modifications; they
were given to me by a technically-inclined friend.

--- GEcho/beta

****
I hope those help....I assume no liability for the above mods...I got them
off some BBS somewhere and just merely passing them along...

(I'm pretty sure they work...no CB bootleggin' there good buddy!)

ICOM IC-725 MODIFICATIONS

MARS MODIFICATION

DISCLAIMER:
This modification allows the radio to transmit outside of the designated
Amateur freq. Transmitting where you are not licensed to do so is
unlawful!

Disassemble radio following instructions on page 24 of Instruction
manual, steps 1 - 7, or as follows:

NOTE: All instructions with the radio's front panel facing you unless
otherwise specified!

1) Remove all black screws from top & bottom covers and remove both covers.

2) Remove the 2 flat head screws that hold the PA unit to the front unit.
(top front of radio - Not the screws that are in the plastic front panel.)

3) Remove the 2 screws that hold the PA unit to the rear panel.
(Looking at the rear of the radio, 1 is above the ext. speaker jack &
1 is above to ACC(1) jack.)

4) Unplug the 2 plugs from J11 & J12.

5) D

6) Disconnect the large black connector on the left side of radio.

7) Slide up and out, the TUNER CONTROL SOCKET from it's holder in the rear panel.

8) Remove the tape from the right side of the PA unit.

9) Swing the PA unit up to the left and lay over flat.
located to the left side, rear of the board, next to J4.
You may have to remove J4 to allow access to D-5.

11) Reassembly is As if you were
opening a book! You now have the PLL unit exposed.

10) Cut Diode D-5 from the PLL unit.
D-5 is loca reverse of above

12) The radio will now transmit from 1.5 MHz to 33 Mhz. (It will transmit even lower but the power output drops off and I don't know if doing so will damage the transmitter.

From: yee@mipg.upenn.edu
Message-ID: <127628@netnews.upenn.edu>
Source record: 281136

: Eric KB6LUY suggested buying the 11-meter band. At first blush it's
: a pleasant thought.

This thread is getting VERY silly. I would be absolutely appalled if such as scheme were possible.

Remember, turnabout is fair play. How would hams enjoy having Motorola (or whatever) buy the 2 meter band so that they can put it to better uses since it is currently "wasted"? I'm sure they can find a nice, expensive commercial use for the bandwidth.

2960. 2m radios for European use

Newsgroup: rec.radio.amateur.misc
Date: 1993-05-20 21:06:46 UTC
From: /R=UTRC/R=MRGATE/U=RJA/FFN=RJA/@mrgate.utc.COM
Message-ID: <01GK9ICK4QAU0001HU@mrgate.utc.com>
Source record: 281098

Can anyone recommend 2m FM radios (both mobile and HT) available in the U.S. that would also have 12.5 kHz spacing (in addition to the 15 kHz spacing used in the U.S.)?? This could be either front-panel selectable or internally selectable or programmable. Also of interest would be a 1750 Hz repeater access tone (either standard or available as an option). I would consider a 2m/70cm rig also, if it had these features.

Any mods for the channel spacing and/or 1750 Hz tone would be appreciated.

My intent is to purchase a rig which I could also use when traveling in Europe where 12.5 kHz spacing of repeaters is used.

Do an experiment for me. Connect your rig to a power source independent of the car's (i.e. use a storage battery or something). What I am curious to know is whether your problem disappears or not. My guess is that it will go away on transmit, but not receive. To cure the transmit, assuming it does go away when hooked to a separate power source, go to Radio Shack and get the 20 amp noise suppressor. These do a reasonably good job. Mount it right near the radio.

I suspect the receive problem is similar to the Honda issues we have been discussing. I have a Nissan Pathfinder and do NOT have this problem except on a very limited few frequencies. On the Pathfinder, the hood and other body panels are grounded to the frame. You might look under the hood of your car and tell us if there is a braid connecting the hood to the frame.

You have my sympathy. We own the Pathfinder which is relatively clean, and an '88 Honda Wagon which is a portable wide-band noise source. With the same model radio in both cars, one works great the other gets LOADS of noise.

We are planning on tearing into our Honda and a friend's on Memorial Day, and will post the results on the net. Good luck with yours. If you find out anything in your experiments, please share the results.

No. I have now taken one trip with my HT, kept in my suitcase (which I carried on). On the first leg, the woman running the xray machine asked me to open the suitcase. I took out the radio, turned it on and off, and she was happy.

On the way home, no mention was made and I didn't have to open my suitcase.

Has anyone sucessfully (or even un-successfully) performed modifications to the Ramsey line of receivers. As I understand, they tune a portion of the given band using a varactor. I'm interested in setting up some dedicated freqs to make these radios either single or multiple freq receivers and sacrificing some of their versatility.

Ideas?

David

2964. QRZ! CDROM Software Update Available

Newsgroup: rec.radio.amateur.misc
Date: 1993-05-20 21:16:49 UTC
From: flloyd@l1-a.west.sun.com
Message-ID: <1tgsg1INNa12@west.West.Sun.COM>
Source record: 281129

Those who have recently purchased the QRZ! Ham Radio CDROM will be pleased to know that a bug fix update to the search and retrieval program QRZ.EXE is not available for anonymous FTP from the host cdrom.com in the directory /cdrom/cdroms/ham. The updated program is called QRZ_NEW.EXE This version corrects the off-by-one-day date display problem.

Also included is the technical description for the callsign database index files and search method for those wishing to develop their own software. Get the file called qrz_tech.txt

In addition, there were a couple of files missing from the /unix source tree, which are available in the file cbsrc.shar.

Again, these files are available via anonymous ftp from the machine

cdrom.com

in the directory /cdrom/cdroms/ham

Feel free to redistribute these files as you wish.

E-mail me direct if you have any questions regarding QRZ!

2965. Re: QSL info need for Pitcairn Island

Newsgroup: rec.radio.amateur.misc
Date: 1993-05-20 21:23:27 UTC
From: dts@banyan.com
Message-ID: <C7CGr4.9BH@squam.banyan.com>
Source record: 281159

How rare is VR6? Look in the callbook. There are at least 5 or 6 hams. There are something like 50 or 60 residents. I worked VR6BX on RTTY last summer and sent a QSL and an IRC. It took a while for the turn around. I suspect Brian sent the return card when he got mine, but mail boats probably do not come that often...

IRC's are available from the post office. One IRC should be sufficient (it was for me).

Note that if the VR6 you worked was one of the Japanese folks who did a DXpedition there, you might need to QSL to them at home rather than on VR6...

73,

2966. DJ-580t & FT-530 opinions

Newsgroup: rec.radio.amateur.misc
Date: 1993-05-20 21:56:21 UTC
From: JMESSING@novell.com
Message-ID: <JMESSING.25.0@novell.com>
Source record: 281132

Sorry to take up bandwidth with this request.
But I am thinking about buying one of these
two radios. Either the DJ-580t or the
FT-530. They both seem pretty close in
features. If there is anyone out there that has
any thoughts on the advantages of one over the
other, I would like to hear them.

Thanks in advance for your help.

Jeff.

2968. Re: Alinco DJ580 Gets HOT!!!

Newsgroup: rec.radio.amateur.misc
Date: 1993-05-20 22:37:17 UTC
From: greg@core.rose.hp.com
Message-ID: <C7CK65.2HJ@icon.rose.hp.com>
Source record: 281137

Dave, it's a design problem. See, they've got these little holes over the microphone that let in a lot of hot air, but there are no holes on the back side to let it out. Some comes out of the antenna jack on top, but most builds up inside and heats up the belt clip. Leaving the battery off is the best way to keep it cool, as there are large spaces around the battery rails for it to escape out the bottom.

:-)

Mine does the same thing. Best thing is to drop to the smaller battery and get a better antenna. Diamond's RH77B works fairly well.

2969. 2m/440 tranceivers in Ford Rangers

Newsgroup: rec.radio.amateur.misc
Date: 1993-05-20 22:49:00 UTC
From: lwwald@lims01.lerc.nasa.gov
Message-ID: <20MAY199317494357@lims01.lerc.nasa.gov>
Source record: 281151

I was wondering if folks on the net who have the above vehicles have had
any problems with mobile FM operation. I am planning to put a 2m/440 radio
in the truck this weekend and would like to hear pertinent experiences.

Thanks..

Larry, KE8GW

```

CONFIDENCE LEVEL: 75%

NOTES:
Predicted geomagnetic activity is based heavily on recurrent
phenomena. Transient energetic solar events cannot be predicted reliably over
periods in excess of several days. Hence, there may be some deviations from
the predictions due to the unpredictable transient solar component.

NOTES:
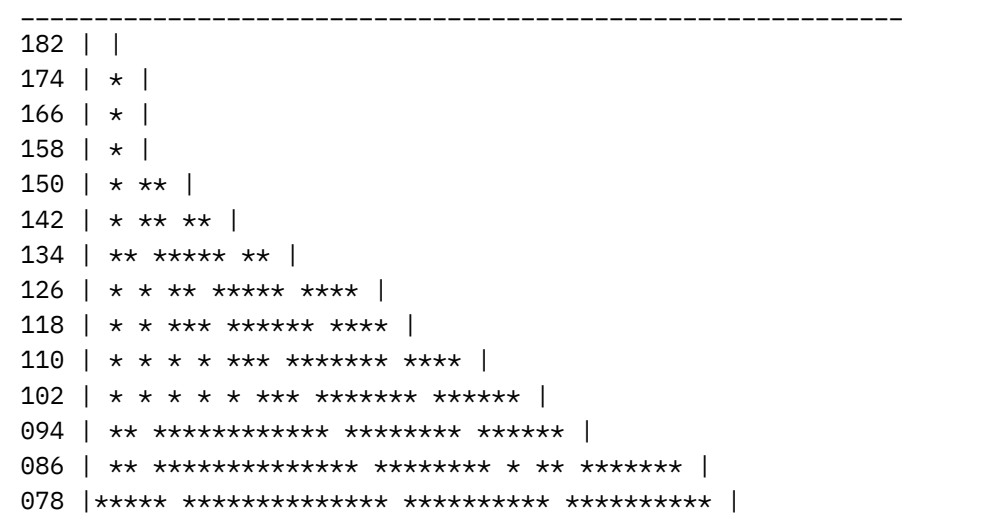
The 10.7 cm solar radio flux is plotted from data reported by the Penticton Radio Observatory (formerly the ARO from Ottawa). High solar flux levels denote higher levels of activity and a greater number of sunspot groups on the Sun. The 90-day mean solar flux graph is charted from the 90-day mean of the 10.7 cm solar radio flux.

CUMULATIVE GRAPHICAL CHART OF SUNSPOT NUMBERS



NOTES:
The graphical chart of sunspot numbers is created from the daily sunspot number counts as reported by the SESC.

Depends upon the phase of the moon. :-)

I carry an HT, flexible J-pole, broken down Diamond dual band mobile antenna, Larsen magmount, homemade power regulator for mobile operation, a notebook PC, and sometimes the desktop charger for my HT through airport security all the time. Usually the worst that happens is my arms get longer. I've had the same airport ignore it all and other times ask me to turn on everything. I once even carried a TK-50 cartridge tape drive through security. Fortunately I had the power cord with me because they asked me to show it working to them. I wasn't also carrying my DECstation with me (not a real portable machine with a 19" color monitor), so I simply plugged it into the wall and they were happy to see the power indicator light come on. What a power indicator light is supposed to prove is beyond me.

So carry it on but be ready to turn it on to show them it does something other than explode.

73,
Todd

Ed-

I'm not familiar with the G5RV configuration, so I only know what I've picked up here in the various flames!

I gather that the G5RV is basically a dipole, about 110 feet long, fed with a balanced feedline of some length. Feedline impedance and length vary among the various reports.

If this is true, I can understand why someone might claim they were getting "ripped off", assuming they are paying some large amount of money for such an antenna. One can certainly build their own equivalent for a few dollars, using insulators, wire and 300 ohm twinlead from Radio Shack. I would think that $25 would cover it easily. How does that compare to the selling price of the commercial version?

If my perception of the antenna is approximately correct, then I see nothing wrong with it except for cost, unless someone thinks they can connect it directly to their 50 ohm transmitter without using a tuner. By using a good quality tuner that can match a balanced line, this configuration should work relatively well, with negligible loss in the balanced line. I suspect that there might be some loss in the tuner if used on 160 meters, and that there would be a multi-lobed pattern on 20 meters and above. (If it didn't match on 160 meters, one could twist the leads from the feedline together, and match it as if it were a long wire.)

So where did I go wrong in my understanding of the G5RV? This certainly has been a popular topic lately. There has been so much emotion and misinformation scattered throughout the various postings, that it is hard to believe the antenna could be as simple as this.

Well other than the fact that it's illegal, it's just fine. Despite your drinking buddies, most airline personel will take a dim view to you attempting to use unauthorized electronic devices on board (especially given the recent hysteria).

Source record: 281141

julian@bongo.tele.com (Julian Macassey) writes:
[Gary's original question deleted, bad sign]
:
: I have been waiting for the annual spate of "Can I use my
: walkie-talkie on a plane" postings. Why do I enjoy this? Well like the
: the "I think I heard a cuckoo" letters to The Times (The real one), it
: signals the start of spring and summer is just round the corner.
:
: I have used a walkie-talkie from a plane many times. The plane
: has never crashed. I used to drink with an SM commercial pilot who
: used his walkie from the flight deck all the time.
Hope it wasn't within 24 hrs. of a flight where he was Pilot. :-)

: The doom mongers will tell you that using a radio from a plane
: will cause it to come down in flames. Then of course they will tell
: you that planes cost so much because they have to make everything RFI
: proof.
I don't think anyone has suggested that it will cause the aircraft
to crash. The original posts were in reference to regulations regarding
the use of a 2m amateur HT on board an aircraft. Okay you made me do it
so here goes: Federal Aviation Regulations 14 CFR Ch. 1 part 91.21:
"Portable Electronic Devices.
(a) Except as provided in paragraph (b) of this section, no person
may operate, nor nor may any operator or pilot in command of an aircraft
allow the operation of, any portable electronic device" (it Then goes on to
specify which flights are effected, basically anything that is not private
pilot VFR)
"(b) Parargraph (a) of this section does not apply to --
(1) Portable voice recorders;
(2) Hearing aids;
(3) Heart pacemakers;
(4) Electric shavers;
(5) Any other protable electronic device that the operator of the
aircraft ofthe aircraft has determined will not cause interference with
the navigationor communication system of the aircraft on whoch it is to be
used"
You are prohibited, by regulation, from using your 2m radio on any
airliner without the operators approval. Most (all perhaps) airlines have
policies against the use of any transmitters on their aircraft. As I said
before many are also considering revoking the priv. of using your laptop
on board. 'Course air mobile in a small airplane is much more fun anyway.

: Now, many cars are somewhat sensitive to RF, this includes
: expensive German cars assembled by disinterested Turks. We do get
: questions about "Can I use my walkie-talkie while driving to work?"

: The answer to that one is "Maybe" or "Your milage may vary".
Car engine dies, pullover. Aircraft engine dies, look for a soft place to
crash and call you lawyers. Welcome to America!! (Apologies to other
non-US Americans)

From: tpang@fraser.sfu.ca
Message-ID: <tpang.737943112@sfu.ca>
Source record: 281146

I have had Kenwood TH-21AT, poor sensitivity, and receiver, but what
do you expect for the smallest HT at the time? Yes, Intermod.
(I was living in Hong Kong)
Then I had the Yaesu FT-23, great, much better sensitivity, some intemod,
don't really care. (I was living in San Diego)
Then I have the Kenwood TH-215, BIG! Now why the hack I changed from 2 small
HTs to a big one? Great loudness, excellent sensitivity, not much intermod.

Now, I am thinking about buying the most feature packed, ultimate dual-band
HT, with lots of receive range. But as living in Vancouver, which model
is tolerable? I am thinking about the 3 newest ones from the 3 biggest
brands. I want small too, as they are easier to get around. If intemod is
such terrible, I'll get a mobile to connect the mobile antenna, or home,
when I save up more money $$:)>.

And of course, if I were a lottery winner, then I'll buy different sizes
to fit different events, and one in my car, one at home,.....(dreaming :)

>As a followup question, are NiMH batteries available for HT's yet? I've
>heard that they're supposed to eventually replace Nicads due to longer
>life. ANyone know when or where these might become available or viable?

A post on sci.electronics said a comparison test was done and during fast
discharge rate (like HT usage), the capacity seems much less. And even
at slow rate, it doesn't live up to its specs. I am not sure if he has
charged it probably, but it seems he does (the author/tester).
Another point, it seems to have very poor shelf life, so it matches another
report of that long time ago.

With all these uncertainty, and high price, I'll wait a bit before I
jumped gun. One thing is I am not sure how to design a good and safe
charger for it, as one report said it is worse to overcharge NiMH than
NiCd.

Everybody seems to think that getting too hot to hold is "normal" for an HT. I've never had my DJ-F1T get uncomfortably hot, even when running on 13.8V with the vinyl cover in place on long transmissions. It does, however, get noticably warm, but not uncomfortably hot.

BTW, I have noticed an obscure reference in the DJ-F1T manual that it has a "feature" that cuts back on the output power if the temperature rises excessively. (No indication of what method they used to implement it.)

This is the very first REAL reply/advise I got. I thank you very very much.
I'll go and find such conductive spray, just is it like spray paint?
where can I buy it? Radio Shack? Electronics Parts store?
This might be better than laying Al foils.

(yea, my modem has 2 TI 320C25 DSP chips running at 40MHz, and a 68000
at 13.3 MHz, which I'll mod it to run at 20MHz, lots of signals, and
how it passed FCC Part 68 and 15 (printed on back) , doesn't say Class B)
Is it Class B equivalent? Otherwise it is great modem). Oh, my monitor
is doing it too, probably too much to do that one, but it's not as bad either.
)

Thanks again for good advise.

2988. Summary of how POCSAG paging works

Newsgroup: rec.radio.amateur.misc
Date: 1993-05-21 01:30:02 UTC
From: die@pig.UUCP
Message-ID: <751@pig.UUCP>
Source record: 281161
Cross-posted to: alt.radio.scanner,rec.radio.shortwave,rec.radio.amateur.misc

The following summary describes the coding used on POCSAG pager signals and may be of interest to those curious about what those ear-splitting beeps and buzzes mean and how they encode data. This summary is based on a very old text of the standard from my files; the current text of the POCSAG standard is available as CCIR Radiopaging Format 1.

Note that some current POCSAG signals (so called Super-POCSAG) transmit paging at 1200 or 2400 baud instead of the 512 baud I refer to here, but use essentially a similar coding standard.

The interested USA reader is reminded that willfully intercepting other than tone only paging is a violation of the ECPA with similar penalties and criminal status to willfully intercepting cellular phone calls.

The interested reader is advised that at least two of Universal Shortwave's RTTY reading devices (the M8000 and the new C-400) are capable of reading at least the older 512 baud version of POCSAG paging, so commercial devices for this purpose are currently being sold in the USA.

And finally, much alphanumeric paging - particularly that installed some time ago, uses a proprietary Motorola encoding format called GOLAY which is quite different from POCSAG. The two can be told apart by their baud rates - GOLAY is 600 baud.

POCSAG

First POCSAG stands for Post Office Code Standarization Advisory Group. Post office in this context is the British Post Office which used to be the supplier of all telecommunications services in England before privatization.

POCSAG as defined in the standard, (original POCSAG) is 512 bits per second direct FSK (not AFSK) of the carrier wave with +- 4.5 khz shift (less deviation than that is used in some US systems). Data is NRZ coded with the higher frequency representing 0 (space) and the lower one representing 1 (mark).

The basic unit of data in a POCSAG message is the codeword which is always a 32 bit long entity. The most significant bit of a codeword is transmitted first followed immediately by the next most significant bit and so forth. The data is NRZ, so that mark and space values (plus and minus voltages) as sampled on the output of the receiver discriminator at a 512 hz rate corrospond directly to bits in the codeword starting with the MSB. (Note that the audio output circuitry following the discriminator in a typical voice scanner may considerably

distort this square wave pattern of bits, so it is best to take the signal directly off the discriminator before the audio filtering).

The first (msb) bit of every POCSAG codeword (bit 31) indicates whether the codeword is an address codeword (pager address) (bit 31 = 0) or a message codeword (bit 31 = 1). The two codeword types have have different internal structure.

Message codewords (bit 31 = 1) use the 20 bits starting at bit 30 (bit 30-11) as message data. Address codewords (bit 31 = 0) use 18 bits starting at bit 30 as address (bits 30-13) and bits 12 and 11 as function bits which indicate the type and format of the page. Bits 10 through 1 of both types of codewords are the bits of a BCH (31,21) block ECC code computed over the first 31 bits of the codeword, and bit 0 of both codeword types is an even parity bit.

The BCH ECC code used provides a 6 bit hamming distance between all valid codewords in the possible set (that is every valid 32 bit codeword differs from ever other one in at least 6 bits). This makes one or two bit error correction of codewords possible, and provides a robust error detection capability (very low chance of false pages). The generating polynomial for the (31,21) BCH code is x**10 + x**9 + x**8 + x**6 + x**5 + x**3 + 1.

Codewords are transmitted in groups of 16 (called batches), and each batch is preceeded by a special 17th codeword which contains a fixed frame synchronization pattern. At least as of the date of the spec I have, this sync magic word was 0x7CD215D8.

Batches of codewords in a transmission are preceeded by a start of transmission preamble of reversals (10101010101 pattern) which must be at least 576 bits long. Thus a transmission (paging burst) consists of carrier turnon during which it is modulated with 512 baud reversals (the preamble pattern) followed by at least 576/512 seconds worth of actual preamble, and then a sync codeword (0x7CD215D8), followed by 16 data/address codewords, another sync codeword, 16 more data/address codewords and so forth until the traffic is completely transmitted. As far I am aware there is no specified postamble. I beleive that all 16 of the last codewords of a transmission are always sent before the carrier is shut off, and if there is no message to be sent in them the idle codeword (0x7A89C197) is sent. Later versions of the standard may have modified this however.

In order to save on battery power and not require that a pager receive all the bits of an entire transmission (allowing the receiver to be turned off most of the time, even when a message is being transmitted on the channel) a convention for addressing has been incorperated which splits the pager population into 8 groups. Members of each group only pay attention to the two address code words following the synch codeword of a block that corrospond to their group. This means that as far as addressing is concerned, the 16 codewords in a batch are divided into 8 frames of two codewords apiece and any given pager

pays attention only to the two in the frame to which it assigned.

A message to a pager consists of an address codeword in the
proper two codeword frame within the batch to match the recipients frame
assignment (based on the low three bits of the recipient's 21 bit
effective address), and between 0 and n of the immediately following
code words which contain the message text. A message is terminated by
either another address code word or an idle codeword. Idle codewords
have the special hex value of 0x7A89C197. A message with a long text
may potentially spill over between two or more 17 codeword batches.

Space in a batch between the end of a message in a transmission and
either the end of the batch or the start of the next message (which of
course can only start in the two correct two codeword frame assigned to
the recipient) is filled with idle codewords. A long message which
spills between two or more batches does not disrupt the batch structure
(sync codeword and 16 data/address code words - sync code word and
16 data/address codewords and so forth) so it is possible for a pager
not being addressed to predict when to next listen for its address and
only turn on it's receiver then.

The early standard text I have available to me specifies a 21 bit
address format for a pager (I beleive this has been extended since)
with the upper 18 bits of a pager's address mapping into bits
30-13 of the address codeword and the lower 3 bits specifiying which
codewords within a 17 codeword batch to look at for possible messages.
The address space is further subdivided into 4 different message classes
as specified by the function bits (bits 12 and 11 of a codeword). These
address classes corrospond to different message types (for example
bits 12 and 11 both zero indicate a numeric message encoded in 4 bit BCD,
whilst bits 12 and 11 both set to 1 indicate an alpha message encoded
in 7 bit ASCII). It was apparently envisioned that a given pager could
have different addresses for different message types.

There are two message coding formats defined for the text of messages,
BCD and 7 bit ASCII. BCD encoding packs 4 bit BCD symbols 5 to a codeword
into bits 30-11. The most significant nibble (bits 30,29,28,27) is the
leftmost (or most significant) of a BCD coded numeric datum. Values beyond 9
in each nibble (ie 0xA through 0xF) are encoded as follows:

0xA Reserved (probably used for something now - address extension ?)
0xB Character U (for urgency)
0xC " ", Space (blank)
0xD "-", Hyphen (or dash)
0xE ")", Left bracket
0xF "(", Right bracket

BCD messages are space padded with trailing 0xC's to fill the codeword.
As far as I know there is no POCSAG specified restriction on length but
particular pagers of course have a fixed number of characters in their
display.

Alphanumeric messages are encoded in 7 bit ASCII characters packed into the 20 bit data area of a message codeword (bits 30-11). Since four seven bit characters are 21 rather than 20 bits and the designers of the standard did not want to waste transmission time, they chose to pack the first 20 bits of an ASCII message into the first code word, the next 20 bits of a message into the next codeword and so forth. This means that a 7 bit ASCII character of a message that falls on a boundary can and will be split between two code words, and that the alignment of character boundaries in a particular alpha message code word depends on which code word it is of a message. Within a codeword 7 bit characters are packed from left to right (MSB to LSB). The LSB of an ASCII character is sent first (is the MSB in the codeword) as per standard ASCII transmission conventions, so viewed as bits inside a codeword the characters are bit reversed.

ASCII messages are terminated with ETX, or EOT (my documentation on this is vague) and the remainder of the last message codeword is padded to the right with zeros (which looks like some number of NULL characters with the last one possibly partial (less than 7 bits)).

The documentation I have does not specify how long a ASCII message may be, but I suspect that subsequent standards have probably addressed the issue and perhaps defined a higher level message protocol for partitioning messages into pieces. The POCSAG standard clearly does seem to allow for the notion of encoding messages as mixed strings of 7 bit alpha encoded text and 4 bit BCD numerics, and it is at least possible that some pagers and paging systems use this to reduce message transmission time (probably by using some character other than ETX to delimit a partial ASCII message fragment).

Steve Mosier (MOSIER@steffi.uncg.EDU) wrote:
: I've been following the G5RV thread hoping (in vain) that someone would work
: through the theory behind its design. So I tried to understand it myself,
: based on the design shown in the ARRL Antenna Handbook, namely 102 ft. of
: dipole center-fed by 34 ft. of 75-ohm twinlead. On 20 meters (what it was
: designed for), that is a 3/2-wavelength dipole, fed by a half-wavelength of
: 75-ohm line. So the radiation resistance of the 3rd harmonic dipole is going
: to be somewhere around 100 to 120 ohms, let's say. But I can't understand
: why we have a half-wavelength of parallel line.

The half-wave line has no effect on the feedpoint impedance on 20 meters.
100 ohms at the feedpoint becomes 100 ohms at the other end of the
twinlead. If all you wanted was 20 meter operation, you could just run
coax all the way to the center of the 1/2-wave dipole.

By the way, I think the twin-lead is supposed to be 300 or 450 ohm,
not 75 ohms.

However, on other bands the 34 feet of twinlead is no longer a half-wave
long. As I understand it, 34 feet is a compormise value that transforms
the feedpoint impedance on the other bands to roughly (OK, VERY roughly)
50 ohms.

: ...But I can find no reason why a coax-fed antenna should not behave
: identically as an all-band radiator, if one ignores the potential losses
: due to feeding a lossy cable at high SWR.

As explained above, if you did this the SWR would be higher than with
the 34-foot matching section.

Another factor is feedline radiation, caused by feeding the balanced
antenna with unbalanced feedline (coax). This problem is worse with
non-resonant antennas. I would include a current-type balun at the
coax-to-twinlead transition. It could be as simple as a few turns
of the twinlead (or coax) wrapped around a big ferrite toroid.

>Bruce Cheney NI7M

You don't send it through the security monitor. You put it in the plastic bucket with the rest of your pocket items and it is passed around the monitor. On the other side, they will sometimes want you to turn it on and open the squelch to prove it can at least be called a receiver. They want to hear the open squelch. Same with camcorders, etc. They had me turn it on so they could see light in the viewfinder and that was all that mattered.

Shows to go ya, if you want to carry a bomb, put a monitor on it and make it light. :)

Generally, I thought it was entirely too easy to carry things like that onto the plane.

As for operating, it's taboo. In fact, the stewardess reminded both my wife and I more than once. You can't even turn it on. For the benefit of the person who asked the original question, the real problem is local oscillator radiation interfering with the IFR equipment. While you may have done it several times, it is not safe to assume that you didn't cause any problem. Just last week, the industry clamped down harder and two of the airlines have said no more laptop computers or cd players while on board. They have had too many problems with rf interference throwing off nav gear.

That's bound to depend on the conductivity of the ice. If it's very low, your antenna is in free space; it it's high, it's on the ground. Do you know the conductivity?

Cheers!

I've noticed that Yaesu rigs seem to be the worst ones for wide-open front ends. If I had to rank them for susceptibility to intermod I'd say:

1) Yaesu
2) Alinco
3) Kenwood

As for spurious signals, well I don't know about the xmit but most of them are pretty close to pure so as not to be a problem.

> It sure would be nice to buy the right rig the first time around!

For HT's, I'd say either the TH-78A or the Alinco DJ-580T, haven't had a chance to check out an FT-530 yet.

Well Mike, we know how consistent Radio Shack's policies are. Remember
the check incident? Why is it, we go to a store in Providence, RI
(University Heights to be specific) and even though they've been taking
Mike's company checks for at least 6 months (and about $1500) they won't
take it now because the address on the BUSINESS check doesn't match the
address on Mike's license.

But go to the Radio Shack in South Attelboro (Emerald Square Mall) and
Mike forgets his wallet in the truck but I have mine. I'm not even one
of the authorized signers on the check. I don't have a credit card on
me, but they took the check with my ID and signature. Hmmm...
Inconsistencies are great.

Tony

Yes, I said the rotating radius was 4mts, the boom according to the specs
is 7.20 meters.

I understand than I will probably not get the same performance I would get
with 5 stacked monobanders but, given the lack of space to rotate something
with a boom longer than 9mt, do you think it is worth the hassle of putting
up a quad like that and guying a tower for the extra wind load, for the
performance you get?

So far, the feeling is that it should be a good compromise...

Hypothetically then, what could you expect to hear on 2M at, say,
35,000 feet? I thought the aircraft's frame would absorb the signals
anyway, unless you have an outside antenna. If not, wouldn't you be
activating repeaters for hundreds of miles?

If the latter >is true, it seems Mike could hope to build a many-element wire Yagi for >optimized communications with us here in the west, and then maybe use a simpler >antenna like a vertical or dipole for casual DX with the rest of the world.

The conductivity of ice is much less than that of water; looking at the CCIR curves here, in the HF region the conductivity of ice is approx one hundredth of that of water (fresh). I know that people on the polar ice cap on expedition sometime use dipoles lying on the ice surface to contact base stations.

Rather than a multi-element yagi, I would think it would be much simpler to use a V or a rhombic. He wouldn't have the tuning problems to start with, and if there's plenty of space the gain could be better than he'd get with a 3 or 4 element yagi, for example.

I was up in Severnaya Zemlya in the Russian Arctic about 3 years ago when there were two base stations for polar expeditions operating. At that time the Russian expedition base was using a 20m delta loop and a half wave dipole; a 2 element yagi was up, but due to the low temps (-40 C and more) part of a matching section had broken, and they couldn't repair it. The delta performed far better than the dipole on the links back to Moscow, and was sloping in that direction. The second expedition, that of Ranulph Fiennes, was more organized, though. They had a commercial multiband dipole (without matching resistors (!)) which was used for general stuff, including the contacts with the two chaps headed for the Pole. A large V was used for the links back to the UK, and performed extremely well. The centre of the V was at about 50 feet, and the legs each about 100 feet. Of course when there was a magnetic storm the whole of HF was almost wiped out (about 80 deg North). When Fiennes was down in the
Antarctic recently, Vs were used again for the HF links back to the UK, and quite succesfully, considering what a rough path that can be.

Anyhow, it sounds like a great trip for you friend! I'm sure the OX call will get much attention.

There's a setup file that defines various defaults (sorry, I can't remmeber what it's called, but it's short and contains ASCII text). It has an entry in it that causes the labels to be in Italian : change it to English.

>each Canadian province, Europe, Asia, South America, Africa, Australia and
>New Zealand. Of course, I use an antenna tuner, and it may be that I get
>a lot of feed-line radiation. Whatever, I go by results vs dollars
>invested. IMO, the G5RV is the best antenna for the price available anywhere.

I swear by my shortened G5RV also! I have the 10-40 meter foot version
which consists a 51 foot dipole fed by 17 feet of 450 ohm ladder line.
It loads up great on 20 and 40 meters which is where I generally work.
I checked the SWR on those two bands and the SWR was between 2:1 and 3:1
across the bands. However, it isn't very good on 10 and 15. It loads up
on 15 at 1:1 but the G5RV sounds kinda dead and the best I can get is
3:1 on 10 meters. As I have a tube rig it will work fine there. Considering
a earlier post that stated that the G5RV was reactive on 40 and 20 meters,
resistive with some reactance on 15 meters and resistive on 10 meters
this would correspond to what I have experienced. The earlier post I am
citing had slightly different values for the 10 and 15 meters then what was
posted in this most recent discussion. Also it was stated in a earlier
discussion that you needed a least 56 feet of 51 ohm coax to get the
G5RV to load up on 10 meters. As I worked another ham who said that
his G5RV would not load up on 10 meters until he added 6 feet of coax
this bears this out. I think the whole discussion centered around
whether the coax would also act as a transformer and work with the 450 ohm
ladder line to enable the G5RV to load up on 10 meters at a reasonable
SWR. The general concensus what that it would and not just mask the SWR.
Any comments? Gee, just when I thought this newsgroup was getting boring
this discussion crops up! 8-)

73!

I recieved a mail from:

Shawn Djernes
sld@nde.unl.edu
N0PEU @ WA0PXW.#SCNE.NE.USA.NA

Shawn, I tried to mail you but it bounced. here is the mail. Maybe of use to others.

Yes the game is Simple, the game is also "Simple". It is based
on a game call Simple Simon. When you start the game (M+PTT+PWR)
it says "Push any key". When you push any key it displays one of
the characters from the top row of the key pad. You then have to
press that key. It goes in a random sequence and you have to
repeat that sequence. eg

Display You press
1 1
13 13
131 131
1311 1311
1311F 1311F
1311F2 1311F2

And so on. When you get to 20 you get into poker game. The 20
scored in the previous game is you bank to bet. I am up to 12 on
the first game. I don't know how to play the second game but
apparently the instructions are in English.

Simon

I'm not an expert in antennas but I remember reading an article in
QST about broad band antennas. The article stated "it's possible
to find an impedance that is constant over a wide range of frequencies.
If an antenna is fed with a matching device at that impedance, for
example 50 ohms to 1000 ohms, it is possible to maintain a flat SWR
over that range." The G5RV uses the 300 ohm twin lead as the matching
transformer. I haven't disassembled the PVC housing, however, I was
told that there is a balun inside.

My XYL did notice that, when ever there's a thunder storm near by, she
can hear an acrhing sound comming from the housing.

I've never had a problem with security and I carry with me when I travel. I travel a lot.

Just to share a story of using it on an airline:
On a trip from Denver to Newark, the plane was diverted to Syracuse due to weather. Once on the ground in Syracuse, we did not know when we would take off and we were held on the tarmac away from the terminal. I asked the flight attendant if I could use a radio. She said "OK" and I proceeded to contact a local ham who called my wife to tell her to go to sleep, I'd be very late. The ham that helped got a big kick out of this and I listened to him tell his buddies on 2m about the "guy on the plane." Nice people, hams.

3020. An interesting New-Ham story

Newsgroup: rec.radio.amateur.misc
Date: 1993-05-21 14:04:06 UTC
From: rdewan@casbah.acns.nwu.edu
Message-ID: <1993May21.140406.22356@news.acns.nwu.edu>
Source record: 281088

Here is an interesting new-ham story.

I met a ham, Jim (not his real name as he wants to remain anonymous) N9!!!, on our club's 2m repeater yesterday. We started chatting and he told me that he was interested in getting going with HF and using CW. We exchanged phone numbers for a follow up. On the phone we talked about how we got into ham radio. I told him about my interest in CW and asked him what prompted him to go in for a Technician-with-code license.

I found his story fascinating and want to share it with you.

He is a neurologist with a specialty in spinal injuries. A few months back he was at a party hosted by a doctor friend, let's call him Rob, who was a ham. It was a weekend party and at some time Rob was in his shack monitoring when he came upon a weak CW signal - a plea for help from a station deep in the Amazon rain forest. Some one had fallen down from a tree and had injured his spine. He seemed quadriplegic with no movement in any extremity. His companion got on the radio to get help. Most fortuitously, his signal was picked up by Rob. When Rob figured out that the spine was injured, he called for Jim to help him. Rob started to relay messages in CW between Jim and the victim's companion.

Jim diagnosed the injury to be a dislocation of the spine. Based on the movements and sensations, as reported in CW by the companion to Rob, Jim figured out the particular vertebra that was dislocated. If this had occurred in US, the victim would have been strapped to a board and taken to a hospital for possible surgery. This was not feasible in the rain forest. Some thing had to be done before the spine was permanently injured. The victim could not be moved without some medical attention first.

Over the next hour Jim described a procedure to correct the dislocation. It involved manipulating the spine by moving the body in some particular fashion to correct the dislocation. The companion, Rob and Jim were succesful in getting the vertebra back in position. The spine was still injured and needed care and so with Jim's long distance help, the companion fashioned a splint for the victim so that he could be transported.

Jim was so impressed with ham radio that he decided to become a ham himself. He realized that code would be the tough part and so he first studied code - pretty much by himself using computer programs. He looked over the theory a couple of hours before taking the test.

He is on the air now.

Is this not a great hobby?

Best regards.

Note: This has been posted with "Jim's" permission. I faxed him a copy of it before posting. There are members of my club who read this news group regularly. They will easily figure out whom I have writen about. I trust that they will not divulge the identity of Jim or ask him questions about this on the air.

* ARSENE NEWS *
===============
According to telemetry sent by ARSENE the satellite is working perfectly.
The problem is that nobody has heard anything on VHF downlink frequency of
145.975 MHz. The control station FF1STA at ENSAE school in Toulouse has put
ARSENE in a mode with complete telemetry sent both in SHF downlink 2446.47
MHz and 145.975 MHz. This was set in order to allow a careful search for a
small signal on VHF band. The ARSENE team is asking for help from all radio
amateurs to find any VHF signal coming from ARSENE. The idea is that the
xtal of the local oscillator could have been broken and that the oscillator
could oscillate on any frequency from 140 to 150 MHz due to the Xtal
parasitic capacitor. The other hypothesis is that the coax was cut between
the VHF PA and antenna. Any report of a signal coming from ARSENE would
help. Telemetry signal basic data are at 128 Hz with 2048 Hz Manchester
encoded PSK at 128 bauds.

The following are new keplerian elements based on observed data from the
ARSENE team 12 hours after ARSENE apogee motor was fired on May 17, 1993
at 11:45 UTC.

* BALLOON TO SATELLITE LINK *
==========
The High Altitude Radio Project plans to launch a weather balloon carrying a one watt Morse beacon transmitter transmitting on a frequency of 145.890 MHz on Saturday June 12, 1993 at about 15:00 UTC. The launch will be under the supervision of Joe, WB9SBD at his site in Hillsboro, Wisconsin. If all goes well, the balloon will be at an altitude of between 80 and 100 thousand feet when its signal will be picked up by the RS10/11 satellite and relayed on a downlink frequency of 29.3852 MHz (+/- Doppler), starting at 15:48 UTC.

RS10/11 will be on orbit # 29923, travelling from north to south and passing over the Great Lakes at this time. Its downlink signal should be audible over most of the continental US, except the extreme west coast, which will be marginal. All of Canada, Greeland, and Central America and most of Alaska, Iceland, and the northern part of South America will be covered.

The purpose of this flight is to:

1) "Just Do It!", since it is not believed that such a balloon to satellite radio link has ever been attempted, and

2) to test the feasibility of using RS10/11 to help track a possible around the world balloon flight to be launched by Joe, WB9SBD later in the year.

Special QSLs will be available for all those who receive the balloon uplink, satellite downlink, or both signals. Reports should also include the date, time, and frequency of the received signals. The balloon callsign will be N9LTD and the calls of the other members of the launch and recovery team will be transmitted periodically.

Please forward all reception reports to:

H.A.R.P.
PO Box 14748
Madison, WI 53708

The rain date for this event is Sunday, June 13, 1993, on RS10/11 orbit # 29937. Launch attempts will continue every weekend until the launch is successful. A list of usable passes, calculated from RS10/11 orbital elements dated May 6 is provided below. An SSB ground station will be parked a few KHz away from the balloon frequency to answer any questions during the flight. (That is why the balloon's beacon frequency is in the SSB portion of the satellite's transponder passband.)

Date Time (UTC) RS10/11 Orbit Number

Sat 12-Jun-93 15:48...16:02 29923 <-- First Attempt
Sun 13-Jun-93 16:18...16:32 29937

Sat 19-Jun-93 15:47...16:01 30019
Sun 20-Jun-93 14:32...14:46 30032

Sat 26-Jun-93 14:01...14:15 30114
Sun 27-Jun-93 14:31...14:45 30128

Sat 03-Jul-93 14:01...14:14 30210
Sun 04-Jul-93 12:45...12:58 30223 <-- Note 2 passes
Sun 04-Jul-93 14:31...14:44 30224 <-- on July 4!

Questions or comments regarding this experiment should be directed to Dave Mullenix on packet at: N9LTD @ WD9ESU.WI.USA.NA, or to his telephone BBS at (608) 249-7130, 300 to 14400 baud.

[Info via Dave Mullenix, N9LTD]

* FO-20 SCHEDULE *
==========
FO-20 will be in Mode JA from 10:50 UTC on 26-May-93 through 11:08 UTC on 27-May-93. The Mode JD packet mailbox will be in operation at all other times.

[Info via Kazu, JJ1WTK/3]

* DOHOP RESULTS *
==========
Here is first report of DoHoP #3 operation.

Window 1: Nothing on this orbit due to too many users of RS-10.
Window 2: Better this than last window. Dave G4CUO worked Oscar DJ0MY, DL1SM, and heard PA3FMG and IK7FGE.

Date Time Sat Lat Lon QRA Separation Worked or Heard
Sub Sat Approximate
==========
16May93 12:54:45 RS14 45.1n 15.4e JN75QC
RS10 55.7n 5.6e JO15TQ 1661 kms DJ0MY
16May93 12:57:10 RS14 53.3n 17.3e JO83PH
RS10 47.6n 5.6e JN27TO 1201 kms IK7FGE

Window 3: On this orbit the transponder was switched off so there weren't any contacts, but it was back on for the next orbit so the new software routine seems to be working.

Window 4: All OK on this orbit and Dave G4CUO worked KM3B, KA8CNI, W8TX, and F9SR. There are other signals on the tape which will have to be noise filtered to make them clear.

16May93 16:25:40 RS14 49.4n 36.4w KN89EJ
RS10 52.5n 48.2w LO42CM 1037 kms KM3B 559
16May93 16:27:20 RS14 55.1n 34.9w KO75KC

RS10 46.9n 47.0w LN36MV 1438 kms F9SR 559

We await further reports from many stations in Europe and USA who heard DoHop signals, but did not transmit. A very successful day with many thanks to Andy, Leo and all in Moscow.

[Info via Ian, G0NKA, of the DoHoP group]

It was really a Yaesu Memorizer house branded for Sears. I've seen a few
at hamfests going for $10-$20 with the "Kenmore", not to be confused with
Kenwood, label on them.

Since security personel often wear a HT themselves, they usually have
a clue as to what it is and what it does. That makes them pretty easy
to get through security. I have had one security guard remind me not
to turn it on in the plane. They usually give me a much harder time
about my Leatherman tool, even though they never comment about my regular
toolbag filled with long screwdrivers, various pliers, exacto knives,
coax strippers, etc. (Don't leave home without it.)

I just read ALL 22! Lots of ZZZZZZZz. The thing that comes through for me is if one ham unit causes a problem we all will not be able to take them along, likely not even in the luggage. Yes I think its likely rediculas except for landings and takeoffs, but the pleasure is not worth any undue risk at 30K feet. Its a ling way down to touch thoes back yard antennas! I have always asked for the top floor in hotels and took off the mike at connector to prevent any accidental operation in the overhead. Mine is 3 watts FM or SSB out on 2. Likely based on future free phone calls that the airline can't charge you for anyway. Lets fight it other ways, such as in their pocket book. We fly on thoes that are type compatible and allow it and not the others. This BB could aid in getting this going. Any takers?

>the ladder line. Again, am I looking at this correctly? BTW, the loss factor
>is a perfectly good reason. I just want to know if that's the ONLY reason.
>I'm a long-time lover of Zepp antennas.

The ladder line won't be "matched" to the flattop either, but because it's
balanced line it shouldn't exhibit feedline radiation. A choke balun
can *reduce* coax feedline radiation, but because of near field coupling,
it won't eliminate it. Ladder line normally has low loss, but then so does
coaxial *air* dielectric line. Loss plays a factor in choosing ladder line,
but the main reason is to feed a balanced antenna with a balanced line
driven by a balanced tuner. With everything nicely balanced, a counterpoise,
or an earth ground, aren't *necessary* to the operation, and the antenna
radiates it's intended pattern. There's many a slip between theory and
practice, however, and oftentimes the physical advantages of coax will
outweigh the theoretical advantages of open wire line.

I've used 5 wire line to feed an unbalanced vertical antenna. (Picture
the dots on a die as an end on view.) This is cheaper than coax at high
power, 50,000+ watts, but it's certainly harder to hang and handle. I'd
have used 6 1/8 inch rigid pressurized coax air line if the budget could
have stood it.

3030. RACES Bulletin #275

Newsgroup: rec.radio.amateur.misc
Date: 1993-05-21 14:54:03 UTC
From: enge@almaden.ibm.com
Message-ID: <9305211517.AA06162@ucsd.edu>
Source record: 281124

Bid : $RACESBUL.275

TO: ALL EMERGENCY MANAGEMENT AGENCIES VIA AMATEUR RADIO
INFO: ALL RACES OPERATORS IN CA (ALLCA: OFFICIAL)
ALL AMATEURS U.S. (@ USA: INFORMATION)
FROM: CA STATE OFFICE OF EMERGENCY SERVICES (W6HIR @ WA6NWE.CA)
2800 Meadowview Rd., Sacramento, CA 95832 (916)262-1600
Landline BBS open to all: (916) 262-1657
RACESBUL.275 DATE: May 24, 1993
SUBJECT: MGT - Follow the chain of command
RACES Radio Officers, volunteer or paid, are part of the
management in the agency for which they serve. In that role it's
proper for them to network and coordinate with their counterparts
in neighboring jurisdictions. This helps when one jurisdiction
needs help and resources from another jurisdiction to support an
incident.
However, here is where Radio Officers must be careful. It is
a natural tendency to contact the other jurisdiction's Radio
Officer and bypass his or her agency coordinator. This could
cause irreparable damage by cutting an official out of the loop.
Some may consider such an act as tantamount to "stealing" the
jurisdiction's resources without their knowledge. Making sure
your Radio Officer understands the proper procedure for inter-
jurisdictional contacts avoids such a faux pas from affecting
your RACES program.
During a major incident, a county RACES officer tried to
reach an adjoining county Radio Officer without success. When
asked if he had contacted that county's disaster director, he
admitted he had not. The mutual aid might have been forthcoming
if the chain of command had been followed.
In another incident the Radio Officer bypassed the agency
official, went direct to the other Radio Officer and stirred up a
hornets nest in the process when the authorizing official
discovered his RACES unit was involved without his knowledge.
While situations vary, and events change, it seems wise to be
sure your Radio Officer understands your policies and procedures.

>where can I buy it? Radio Shack? Electronics Parts store?
>This might be better than laying Al foils.

Most major electronic distributors carry the GC brand chemicals. There
are a couple of cautions when using this stuff. Of course you want to
spray it on the inside to avoid making the equipment look bad. This
requires that you take the modem apart so there's no chance of getting
any of the spray on the circuitry. Test a small segment of the cabinet
with the spray first to make sure it doesn't attack the plastic. It
won't attack most plastics, but better safe than sorry. Also look
carefully to make sure that none of the sprayed surface will come
in contact with circuitry when you reassemble the modem. Wouldn't
want to short anything out. If it looks like something could touch,
use some "fish paper" to insulate it.

>(yea, my modem has 2 TI 320C25 DSP chips running at 40MHz, and a 68000
>at 13.3 MHz, which I'll mod it to run at 20MHz, lots of signals, and
>how it passed FCC Part 68 and 15 (printed on back) , doesn't say Class B)
>Is it Class B equivalent? Otherwise it is great modem). Oh, my monitor
>is doing it too, probably too much to do that one, but it's not as bad either.

You can do the inside of the monitor case too. But be very careful of
the areas near the HV. You may want to install fish paper here as well.
Most monitors don't radiate much through the screen, color monitors
almost never do due to the mask, but it's sometimes a problem with
monochrome monitors. If so, a fine screenwire mesh can be placed over
the monitor face and grounded to the conductive spray in the cabinet,
a friction fit will do. This mesh will act as a shield, and also do
double duty as an anti-glare filter for the screen.

I don't think the conductivity of ice has much to do with it. The real
issue is the dielectric constant of ice. Anybody have a reference handy?
That could drastically change the tuning of an antenna laid on ice.

Well, on frequencies where the antenna is a good match, the resistor
will only drop power by 3 db. Your attenuator always drops it by 6 db.

While many commercial G5RV style antennas do this, it's not a really
good idea if you're going to run any power. At certain impedances,
the current at this point can be quite high, and can saturate the
ferrite. It'll then get hot and fail. If you use a balun, an air
core type would be preferred. Six or eight tight turns of coax
will do.

>the '530 out the prices seem to be going down.

I love my 470, but when it came out it was roundly condemned as the
worst with respect to intermod of any of the then available dual
banders. Of course now all the old good radios are gone, and the
new crop is much worse, so the FT470 looks like a champ by comparison.
I love the FT470 user interface, I love the ruggedness, I can live
with the intermod, and current prices are very attractive. I'd say
go for it.

>I always put my HT in my carry-on when I travel (but have never used
>it on the plane), and I have never been questioned about it.

I only had one incident, and that was flying out of DULLes a few years ago. It was kinda like the STUPID Panasonic commercial where this guy gets harrassed about the faceplace for his car stereo.

Anyways, it cost the OF running the gate his job, because I went direct to the station manager of the airline I was booked on.

I was _pissed_, people. And, because of that, I will ALWAYS recommend Continental.

Not to turn this into rec.radio.electrochemistry, but the conductivity of water depends upon the amount of ionic impurities dissolved in it. We use purified water in my lab which has a resistance of ~18 million ohms/cm. Sea water, on the other hand, makes an excellent (if corrosive) ground plane because it conducts electricity very well due to dissolved ions. I'm not sure what the ionic mobility is in ice compared to water, but I imagine, as Al suggests, that it would be lower, making ice a good insulator regardless of the purity of the water from which it was created.

This is HORSESHIT. If there has been any demise of 2m (which I doubt), it's been caused by inconsiderate and rude behavior; hardly a result of RS policies. As much as I disdain some of RS practices, they have been a stable source of parts, equipment, and kits (yes, I've built a few of the kits that used to hang next to the leather working tools). They've helped many a small boy pursue his budding interest in electronics.

3042. Remote control features of the Kenwood 742A

Newsgroup: rec.radio.amateur.misc
Date: 1993-05-21 17:03:38 UTC
From: stevel@aio.jsc.nasa.gov
Message-ID: <1993May21.170338.29061@aio.jsc.nasa.gov>
Source record: 281108

I have been looking at buying a Kenwood 742A dual-upgradeable-to-tri-band radio.

Has anybody had any experiances with the rig (good or bad :-)?
I understand that there are lots of capabilites to remote control the rig using dtmf tones, but there are no indications of it in the sales literature. Has anybody played with them? Is the CTCSS board necessary/ desireable to use the remote control function?

How about the 6m add on board?

Thanks for any advice..

system@garlic.sbs.com (Tony Pelliccio) writes:

>Simple, Radio Shack is more prominent and available to people. I mean,
>how far can you go without at least seeing a franchise? :)

Very true. One reason why RS poses a problem is that all the CBers go there
to get their latest and greatest 40 channel rig. Then, they walk in,
see this "neat walkie talkie" on sale, and will go and buy it instead,
regardless of whether or not they have a license.

The likelihood that this will happen at an HRO or AES store is slim.

3044. Balanced feedline (was: G5RV)

Newsgroup: rec.radio.amateur.misc
Date: 1993-05-21 17:09:04 UTC
From: mbutts@mbutts.mentorg.com
Message-ID: <1993May21.170904.29121@news.mentorg.com>
Source record: 281111

I was about to suspend a full-size G5RV between a pair of very tall trees at our new place. Now I'm not so sure. I want an all-band antenna for both hamming and SWL. I'm only putting up one HF antenna. I already have a tuner (AEA Econotuner) which has a transformer for balanced feed. So I'm thinking a "Zepp" fed by "open" twinlead (the stuff that's about an inch wide, 450 ohms I dimly recall, that they have at Portland Radio Supply) might be just the ticket. But I have questions.

First, the lack of shielding. Will this subject me to more noise picked up from the house and shack, such as computers and power lines?

Second, I'm planning to use the 'dryer vent stuffed with foam' method shown in the ARRL Handbook to get the feedline, plus several 9913 coaxes for VHF, into the house. How much clearance is needed to avoid messing up the balanced feedline?

Third, is there any allband wire antenna with shielded coax feedline that stands up to proper analysis? I think the big appeal of the G5RV is the belief that it's an efficient allband wire antenna with coax feed.

Date: 1993-05-21 17:12:52 UTC
From: sampson@etowah.cs.unca.edu
Message-ID: <1tj2ik$302@balsam.unca.edu>
Source record: 281114

I recently have been debating purchasing an audio filter to accompany my kenwood ts520s. My question is for the ones in netland with experience with both the older style resistor/capacitor type filters (ie. The Autek Research type) and the newer DSP type filters. I have noticed that for only around 50 bucks more I could try out one of the new DSP filters with the automatic notch filter for stations tuning up on frenq,etc. How is the performance of these new filters? Are they better than the older style and is the additional cost worth it. Thanks in advance. Feel free to reply here or via email via this account.

>SWR. The general concensus what that it would and not just mask the SWR.
>Any comments? Gee, just when I thought this newsgroup was getting boring
>this discussion crops up! 8-)

No amount of 50 ohm coax is going to provide a match. If varying the
length of the 50 ohm coax changes the SWR, then there is probably
current flowing on the shield of the coax. To provide a match using a
series-section transformer, i.e. an impedance matching transformer
made out of transmission line, the characteristic impedance of the
transforming section must be different than the characteristic
impedance of the line going to the transmitter.

alanb@sr.hp.com (Alan Bloom) writes:

>I don't have the Antenna book in front of me, but wasn't the 75 ohm twin
>lead to be used AFTER the 450 ohm feedline (where the coax usually goes)?

The picture of the G5RV clearly labels the feedline connected to the
102' section of line as 75 ohm twin lead. Using twin lead after the
450 ohm open wire feed line wouldn't make sense as you'd loose the
advantage of a coaxial feed line. As I also stated, the Antenna Book
is probably in error as several other sources indicate a feedline of
300-450 ohm open wire line.

While the faq for this group has a discussion of this, I will
mention that on a recent Northwest flight up the east coast,
the "fasten seatbelts, put your tray tables in the upright
position" announcement before the flight specifically included
turning off personal computers, cell phones, radios and electronic
games as part of the announcement.

Northwest, at any rate, is making it's policy clear.

Are you saying that HRO or AES will not sell ham gear to an unlicensed individual OR are you saying HRO or AES don't have potential CB customers who might buy a 2m HT because they see it on the shelf?

Regardless of your answer, I think its time to review some things.

1. As screwed up as CB might be, the situation on the CB channels seems much less of an anarchistic situation today, then it was when CB interest excalated in the late 1970s and early 80s. I have used a CB, typically on channel 19, while traveling and find much less garbage being spewed there today then in the past. Is it a pristine operating environment, certainly not, but it's nothing like it was in the past. Seems to me the interest level in CB just isn't anywhere as high as it was 10/15 years ago.

2. The typical CBer isn't about to fork over $200+ to buy a 2m HT on a whim. Sure they may see the unit, but most (not all mind you) won't even give it a second thought at the $200 price tag.

Personally, I hope RS expands their ham radio offerings (anyone from Tandy read this list?) How about a redesign of the 10m transceiver to 6 meters? How about a 70cm HT? How about a real basic 2m mobile with 25 watts?

For those that would limit selling of ham gear to just the HRO, AES and others, I say, "great if you live near one, but this is a big country and I'm glad I can get some of my ham radio needs taken care of at the neighborhood RS."

Bottom line is...if a CBer wants to bootleg on 2m, they'll get the equipment any way they can (guess all those hamfest sales are limited to only licensed hams...:-)

>both hamming and SWL. I'm only putting up one HF antenna. I already
>have a tuner (AEA Econotuner) which has a transformer for balanced feed.

Then don't worry about putting up a G5RV. Use the tuner and reasonable
quality coax and you'll be fine. There may be a substantial SWR on the
coax, but the tuner will provide a conjugate match returning all (most) of
the power back to the antenna. As Gary pointed out, if the feedline losses
are low, the high SWR isn't a problem if you have a tuner.

>Third, is there any allband wire antenna with shielded coax feedline that
>stands up to proper analysis? I think the big appeal of the G5RV is the
>belief that it's an efficient allband wire antenna with coax feed.

I suspect its "efficiency" is as good as any wire antenna of its length is
going to be. My recommendation is put up the highest longest inverted V or
other random wire you can, place a current balun on the feedline to prevent
current from flowing on the feedline, and use the tuner to give all band
operation. If you didn't have a tuner, I'd suggest a parallel or stubbed
dipole as they can provide all band coverage with a good match.

3052. signal to pagers????

Newsgroup: rec.radio.amateur.misc
Date: 1993-05-23 12:13:15 UTC
From: grushmel@rumrunner.Corp.Sun.COM
Message-ID: <1tnpor$7k7@jethro.Corp.Sun.COM>
Source record: 280900

Hello,

Sorry if this post is way out of place in this group, but have any of you come across a description of the "radio" signal that is sent to a digital pager? The pager I have has its frequency on the back of it, and I was trying to figure out a way to send the appropriate signal to it to set it off and display a specific numeric number on the display.

I'd like to build a small transmitter that can be connected to an auto alarm. Something that would have a short range (e.g. a large parking lot, plus a little more).

Any ideas/pointers you have would be great,

Steve Gruelle steve.gruelle@Corp.Sun.COM

>to be capable of faster code than they imagined.

Absolutely no argument there, but I do have an addition to make.....
Not only are people often (usually?) capable of copying faster than they
think, there is also the fact that by taking the higher code speed tests,
you also get two other major benefits:

1) you get your stress out of the way before taking the 13 wpm or
5 wpm (whichever you're going for)
2) after trying to copy 20 wpm, 13 wpm sounds slow.... ditto for
5 wpm (only much more so).

I suspect, based on my experiences when I took the code test for my general,
that reason #1 above (getting rid of your stress before the test that you're
really after) is probably the most important, with the second reason being
that you probably can copy faster than you think. And finally, reason #2
above fits into the picture, too. When you add it all up, there are 3 very
real reasons to take the higher speed code tests first, and absolutely
nothing to lose! :-)

ez006683@othello.ucdavis.edu (Daniel D. Todd) writes:

> Guess this is a misunderstanding on my part. I always thought
> that a quagi was a multi-element quad that used yagi spacing and element
> scaling. If this is the case and the parasitics are built so they don't
> have a tuning stub then they would look the same every 90 degrees of
> rotation.
Well, you'd be correct *if* that were a quagi... what you describe,
however, is really just a quad antenna with quad-type parasitics which
would have no "polarity" of their own. The spacing and element
"length" (loop circumference) will impact resonance and feedpoint
impedance (full wave director; 105% reflector; and 96% directors should
give 288 ohms on "perfect" conditions -- hence the common use of
tuning stubs and 4:1 baluns at the feed) as well as gain and
front-to-back...but what I believe you have described is still a quad.
(See: Orr, "Cubical Quad Antennas" 2nd Edition.)

BTW, a meaningless aside, but I gotta share this in here: about 15
years or so ago, I was mobiling along on HF and answered a "CQ" from a
very strong station, W9LZX. On the second over, Clarence says: "Of
course, you know I am the inventor of the cubical quad." Well, there
was no of course about it...I thought he was full of sh*t (but
politeness prevented any rude remarks...and I am glad, for when I got
home a few days later, I flipped open Bill Orr's book and whaddaya
know? Ol' Clarence DID invent the damned Cubical Quad!!! Coulda
knocked me over with a sledgehammer! ;^)

Best "quagi" design I recall was a VE(3?) who built a "Razor" which
used a quad driven and reflector elements with regular yagi-uda type
parasitic directors. *That* is the configuration I took to be the
basis of the question,, and in that configuration, having the
parasitic directors aligned with the plane of the driven element's
polarity is critical to the workings of the antenna.

> If I ever get a place
> where I have enough room to play I will build some wire antennas and even
> RTFM :^). ^^^^
Geez, Dan. Please do NOT wait until then to PLAY!! ;^) Have fun NOW!
Even in confined areas, wire antennas are fun and they really WANT to
work -- hell even antennas that the books all say won't....WILL!

> what's best if I can only get one of the books right now?
Probably Krause W8JK and his antenna book. You should be able to find
it in the UC-Davis library -- it is big and deep and well worth the
time to wander! Best of Luck... ;^)

Cross-posted to: misc.forsale.computers.other,misc.forsale.computers.d,rec.radio.amateur.misc

I've updated my system and need to do some housecleaning.
Reasonable offers considered.

FOR SALE Computer System #1

Tri-Star 80386/20-MHz system

o 8 Mb RAM installed on motherboard
o Slot for additional RAM board
o Math coprocessor installed
o Two (2) 65-Mb Mitsubishi hard disk drives
o One (1) 3.5-inch, 1.44-Mb floppy
o One (1) 5.25-inch 1.2Mb floppy
o NEC 3D 14-inch SVGA monitor with tilt/swivel stand
o Boca Super VGA video card with 1 Mb RAM (ET-4000 chip)
o 200-Watt power supply
o Tower case
o FK-2001 keyboard
o Operating/technical manuals

System is in *excellent* condition: $1300, or best offer.
(See Tri-Star's ads in "PC Magazine.")

Computer System #2

XPC 8088 4.77/8-MHz turbo system
o Math coprocessor installed
o Two (2) 360-kb floppy disk drives
o One (1) 30-Mb hard disk drive
o BASIC in ROM (use with IBM BASIC/BASICA files)
o CompuAdd 12-inch mono VGA display (almost new; used little)
o ATI video card with 512 kb RAM
o Desktop case
o 200-Watt, double-fan power supply (not the 65-Watt original)
o Northgate Omnikey Plus keyboard
o Operating/technical reference manuals

System is in *excellent* condition: $350, or best offer

Other Items available:

Boca SVGAX1 Super VGA card, 1 Mb RAM, 32k colors $100

Epson LQ-850 printer, like new, very little use $350
(Printer is supplied with six (6) new ribbons.)

Epson ribbon re-inker.....$25
(Works *very* well and pays for itself quickly.)
Computer floor stand for vertical mounting $5

Central Point Copy II Plus Option Board and software, and the
Copy II PC sofware-only version. Both for.....$40

IBM PC-XT technical reference manuals (2): "Technical Reference

Personal Computer XT and Portable Personal Computer" and
Hardware Maintenance Service." Both for $35

HP-16C Programmer's Calculator (like new).....$35

Vanguard WEPIX 2000-B Environmental Satellite Receiver...$300
(This receiver is brand new, never put to use.)

Vanguard WEFAXTENNA Model APT-2 with low-noise preamp.....$100
(In very good condition. One (of eight) ground-plane rod
broken. Preamp mounts internally at the antenna -- protected
from the elements, or you can remove it for in-station use.
BNC connectors on cable make this very easy to do.)

OFS weatherfax board and software.....$250
(V 2 and 3 software. Can be easily upgraded to add recent
circuit changes and V 5 software. See the OFS ads in
"Weatherwise," "QST" and other magazines.)

Software available:

Norton Desktop for DOS (unopened).....$45
Lotus Magellan.....$25
Microsoft Macro Assembler 5.0.....$50
IBM Macro Assembler 2.0.....$50
Gato.....$15
(Action game with a modern edition of Cornelius van Drebble's
submersible.)
F-15 Strike Eagle.....$15
(Action game in which you pilot a recent version of the Wright
brothers' invention.)

I prefer pick up of the larger items. Otherwise, please add
shipping costs. I refund overpayment in excess of $1.50.

Please provide me with your full address and a daytime phone
and/or fax number at which I can reach you.

Thanks.

Fred McKenzie (fred-mckenzie@ksc.nasa.gov) wrote:
:
: It turns out that the HTX-202 is compatible with Icom battery packs for the
: old IC-2AT. Some of these packs are available at a higher voltage, and can
: be rapid-charged from the Icom BC-35 charger. I suggest you get
: information about this from either Icom dealers, or from battery
: manufacturers who offer less expensive packs. If someone would research
: specific battery model numbers, and the resulting radio output power, the
: information would be a good follow-up posting.

The ICOM IC-CM8 battery pack works great. It has 8 of the 1.2v nicads in
it of course, for a total of 9.6v when fully charged. I get a healthy
6 watts out with it. The only catch is that both the radio and the pack
have a ball detent ... you will need to remove the one from the pack,
for a snug fit. Minor disassembly of the pack is involved ... takes
about ten minutes. I got lucky and found my pack at a hamfest for $15.

From: fkf1@cornell.EDU
Message-ID: <199305251617.AA29151@postoffice.mail.cornell.edu>
Source record: 281037

Re: the operation from Greenland - has your friend considered taking satellite equipment along? The antenna are small, don't have to be circularly polarised, can operate low to the ground, and propagation to the states is reliable and scheduled! Oscar 13 provides good coverage of most of the northern hemisphere twice a day, and for about 4 hours around apogee linear antennas work well and pointing can be done manually (armstrong method) about every half hour or so. If I wanted reliable communication stateside, that's what I'd bring.

3059. Re: Automatic Level Control for DSP Audio Input

Newsgroup: rec.radio.amateur.misc
Date: 1993-05-25 10:25:31 UTC
From: n4hy@tang.ccr-p.ida.org
Message-ID: <N4HY.93May25102531@tang.ccr-p.ida.org>
Source record: 281029

The performance of the program running on the DSP chip will be critically damaged by the wrong time constants on the analog circuitry in certain modes. If you primarily intend it to be used for voice/cw/constant envelope modes (RTTY/FSK/PACKET) nothing much can go wrong. HOWEVER, if you use it for WEFAX-APT or other such amplitude modulated data signals, the performance will be adversely impacted by wrong AGC time constants. I suggest that you make a copy of the app-note from the Signetics books and supply a brief but careful description of how to adjust the resistors/caps on the NE577 to adjust this. In the work on the AEA DSP2232, we had to finally supply a method to change the AGC time constants or to remove them from the circuit by digital control means (some outputs from the 8536) in order to cover all the bases.

How would you like someone to deliver the same information to you?
Tell him that way.

Before you do -- make sure you know that it's him and
not you. Ask the other station you're working if they also hear him.
You might have a problem with your station. Try putting your attenuator
in -- he might be overloading you. Put your tight filter in. Make sure
he's really being a problem before complaining, then complain in gentle
terms. Be prepared for a nasty rebuff and handle it well if it comes.
You've just done everything you can do. Relax and let it go at that.

The University of Central Florida Amateur Radio Club and the
Central Florida Repeater Association will hold thier semi-annual
free Tailgate Party in the Education Building Parking Lot at UCF
on June 19, 1993. Talk-in will be on 146.64 (- no tone) or
147.06 (+ 103.5 tone). The tailgating starts early, about sunrise
to avoid the heat of the day, and continues until about noon.
Usually, there are about 70 - 100 cars that show up for
this event, but there is plenty of room for more. So drop by,
meet other hams and enjoy yourself.

>
>It seems to have poor sensitivity on that compare with 24at... Is that
>nornal???
>could someone help me??

It depends on *how* poor it is. I had a 2sat and a 4sat at one time.
Both were considerably less sensitive than other rigs I compared them
with, especially when used with their issue stubby ducks. On the other
hand, they weren't *extremely* deaf, I could hear any repeater I could
hit. They could certainly hear well enough to suffer intermod. :-)

Most HTs are *too* sensitive, so don't be alarmed if you can't detect
very distant weak signals with your radio. As long as you can hear those
who can hear you, you've got a good balance. Do try a different antenna,
however, the issue antenna does really suck.

> No photo copies.

Actually, if I want to photocopy the Q signals or DX prefix list to stick on my desk rather than ripping the page out of the book, I believe this comes under the Fair Use doctrine.

The other point you have to realize is that while the representation of the data in the callbook may be copyright, the data itself may not be. There have been numerous court decisions about the data in directory type publications. I doubt that anybody would consider that looking up an address in the book and posting it is going to be a violation of the copyright. Feeding the whole book into a database, yes, but manual use of the book, even for people other than the subscriber is not a violation.

In addition, the most convenient form of the US call sign data is through electronic databases, some copyright, and some not. The callsign databases on the net are almost (if not all) derived from a cooperative group of hams that chipped in to purchase the tape from the government and a very hard working (and slightly crazy) guy who duplicated all the tapes and sent them out.

: oo7@astro.as.utexas.edu

I've been buying/selling trancievers for several years, now. I've never
had a license. I've also never had the urge to become a jammer, or other-
wise transmit illegaly. I'm quite happy listening. I buy x-cievers as opposed
to recievers because they seem to hold their value much better.

It seems that making this pattern unavailiable to me would be yet
another example of the good paying for the sins of the bad. Legislation
is seldom the best soloution.

(there are already too many dealers who won't sell a transmitter without
proof of a ticket. is this, defined legaly, discrimination?)

Dave

Date: 1993-05-25 14:39:00 UTC
From: M.Willis@ee.surrey.ac.uk
Message-ID: <1993May25.143900.10846@EE.Surrey.Ac.UK>
Source record: 281033

Please can somone help with the following points

RE: I need to get hold of the Upgrade for my MFJ1278T to allow pactor etc.

1. Has anyone done the upgrade and found it worthwhile?

2. Are there any dealers easily contactable who will export from the USA. East Coast is best as it is closer?

3. Do MFJ sell direct?

Source record: 281031

Just because someone is selling an antenna and calling it a "G5RV" is no sign that is IS a G5RV.

If you decide to build your own "G5RV" and make it 79.5 feet instead of 102', then IT'S NOT A G5RV any more than a 14-oz loaf of bread is a "ONE-POUND LOAF" or 11 doughnuts is a dozen.

It must just be "newspeak".

I corrected myself in a subsequent post. The 6th edition VE Manual
states on page 55 that elements may now be given out of order
at the discretion of the VE team. This is a recent change (relatively);
the preceding edition of the mamual required VEs to administer the elements
in ascending order.

Do you oppose the concept of lending libraries, too? I know of a couple of
community libraries that are subscribers to this callbook. Who can read
the copyrighted book in a library?

>3. No part of this publication. Not the Q codes. Not the Oblast list. Not

> not sent via the radio whether by Packet, Voice or (gasp) Morse Code.

With the availability of computer forms of the same information, such as
the Buckmaster CDs or the Internet servers that got the info directly from
the FCC, why is this even a consideration?

>And finally, why does it always seem that some hams seem to think that an
>Amatuer Radio License exempts them from copyright laws? "But I need that
>(insert the type of information needed here) for my (list convenient excuse

>here)." Or, "It's just a (Schematic, or tune-up, specification sheet etc.)"

Copyright laws have been abused from both sides. Is it right to copyright information that is not your own? Did the callbook company go out and contact each ham to insure that their publication was accurate or did they simply copy the relevant portions of the FCC records, like everyone else did? If you learn something from a copyrighted book and then teach it to someone else, have you violated the copyright?

No one monitors what is placed in copyright messages. They can write anything they want, even if it has no basis in copyright law.

>Are these the same hams that keep claiming they need 100 foot towers with
>no building permits for "emergency" operation? Are these the same hams that

>pretty accurate (as opposed to the ones in may of the same year),

I have a horizontal 80m full wave loop up 22 feet. I also have a
GAP Voyager IV vertical that is 45 feet tall with a 8 foot top hat.

The 80m loop performs better than the GAP on 30m and 20m. I have
had good luck on 20m thru 10m on it. Because of its low elevation,
the radiotion pattern of the loop on 40m is not good: it is shaped
like and apple. The GAP is very good on 40m where it is essentially
a vertical half wave. The loop is much too low for 80 and 160m.
Initially, I fed the loop with a ladder line. Unfortunately I have
metal gutters and I could not decouple the ladder line from the gutters.
The TVI was bad. So I replaced it with 9913 with an air choke balun
made of 10 turns of coax on 6" dia at the feedpoint. It solved my
TVI problem.

All in all the antennas have worked out well. I have worked
a 120 new countries CW barefoot since the last field day. Plus
some more while putting out about 500 watts.

>SMITH12.ZIP Hams: Interactive Smith chart calculator

Motorola CS Products division have a nice Smith Chart based Impedance Matching programme available for the PC. It is very good, having all the Motorola high power devices with input and output impedances as a function of frequency. You can use these as a starting point, adding various passive elements to achieve the desired match (or just use the L/C/TX lines etc to match what you want). It's menu/mouse driven and is really easy to use. (see article in RF design Jan 1993)

It's available from Literature distribution centre - disk DK107/D.
(602)-994-6561
It was no charge to me, but as they say, prices may vary.

3074. Your Opinion on ICOM 229A

Newsgroup: rec.radio.amateur.misc
Date: 1993-05-25 15:55:45 UTC
From: scotbri@flower.rosemount.com
Message-ID: <1993May25.155545.4740@rosevax.rosemount.com>
Source record: 281076

I've been thinking of getting a 2 meter mobile rig for use in my truck but mostly for in the shack. All the brands (Kenwood, Yaseu, Alinco, Icom) look about the same to me as far as performance/features. Our local ham shop has the Icom 229A on sale this month for $298 and looks pretty tempting. Any comments good or bad on this rig vs. all the others? This is the 25W version, the 229H which is the 50W is not on sale but 25 watts is fine for my needs. I don't need alot of fancy features, just solid performance for ragchewing, net participation,etc. Thanks in advance.

>NON-conducting 'ground.' "

If you will look at the Handbook chapters on transmission line theory
and wave propagation, you'll find that dielectric constant and velocity
of propagation are intimately related. With an antenna lying on ice,
the wave is at the interface of two very different areas of dielectric
constant. This is a situation similar to microstrip line on circuit
board. This will drastically affect the tuning of the resulting antenna
structure.

From: mkb@cs.cmu.edu
Message-ID: <C7LE91.KDF.2@cs.cmu.edu>
Source record: 281053

This is a two part question. First, I'd like to experiment with antennas in the 2m, 70cm, and 33cm bands, at moderately low power (less than 25 watts). What tools should I be looking for, in terms of power and SWR measurment and tuning? I'd like to keep things on the cheap side...

Second, I'd like to purchase a better antenna for a 2m HT. Something that collapses, like a telescoping whip, would be ideal. I'd also like the option to come off the radio at 90 degrees, maybe just using a right angle BNC adapter (any potential problems here?). Any suggestions for an antenna?

Finally (okay, three questions), MFJ seems to heavily advertise a variety of inexpensive antennas and realted gear. Any opinions one way or another on their products (specifically or in general)?

Thanks! Mike Blackwell mkb@cs.cmu.edu

Upon reading the thread about the Callbook, I wonder what the copyright status of the ARRL repeater directory. After all, there is the "Repeater Mapbook". Furthermore, the information contains COORDINATED repeaters. Such repeaters have status with the FCC over uncoordinated repeaters. I believe the ARRL calls it the "National Repeater Database" or some such. Is the ARRL handling the database as an agent of the FCC. If so, the data may be in the public domain.

|> these or other concerns are in fact "real world" problems.

If you're in an area with antenna restrictions, you can load them up against ground on the HF bands. (I've done it). You can also load up metal raingutters and downspouts.

As far as BCB reception, It doesn't really block it that much. On FM, the signal will come in the windows and diffract around in all kinds of funny ways. You may have to play with the placement of the antenna because of this, though.

I've found that putting the antenna opposite a window usually works best.

Kurt Sterba and Lil Paddle write a column for a magazine called World Radio. The column debunks the myths and misconceptions about antennas, gain, efficiency, etc. One example was an advertizement which claimed an antenna having 3dB gain over a dipole... where the antenna WAS a dipole... Kurt loves to make fun of these things.

The names of the authors are unknown. Kurt Sturba is a pen-name. The bottom of the column usually says something like: Kurt and Lil keep their identities secret so that they can go to their local radio club meetings and not be asked...

World Radio has published two books of the columns, both of which are recommended reading, for the humor content as much as for the antenna information.

The magazine World Radio is an inexpensive newsprint publication packed with news on goings on in the world of amateur radio. It is well worth the $12 or so a year.

[discussion of Callbook copyright issue deleted]

>And finally, why does it always seem that some hams seem to think that an
>Amatuer Radio License exempts them from copyright laws? "But I need that
>(insert the type of information needed here) for my (list convenient excuse
>here)." Or, "It's just a (Schematic, or tune-up, specification sheet etc.)"

This behavior is hardly unique to hams. After seeing the rampant software
piracy that exists, I long ago concluded that only the prospect of being
caught keeps most people from holding up banks. Hams are no worse than
nonhams when it comes to flouting copyright laws.

3087. Shortened G5RV's bands?

Newsgroup: rec.radio.amateur.misc
Date: 1993-05-25 18:32:24 UTC
From: jeffj@cbnewsm.cb.att.com
Message-ID: <C7LI63.3GB@cbnewsm.cb.att.com>
Source record: 280979

I have a shortened G5RV that susposedly covers 10-40 meters. I have noticed that the antenna loads up great on 20 and 40 meters. I checked the resonant lengths of those two bands and came up with the following,

20 meters, 49.43 feet or 3/4 wavelength.
40 meters, 48.75 feet or 3/8 wavelength.

As the antenna is 51 feet long it appears to be fairly close to a resonant wavelength of those 2 bands. I can set my MFJ antenna tuner to one setting and work the whole 20 meter band with SWR's under 2:1 at max. On 40 meters I have to play with the setting's a bit more as I tune across the band. Here's part of my question, what is the impedence of 20 meters at 3/4 of a wave and 40 at 3/8 of a wave? The 450 ohm ladder line acts a transformer and so I assume causes the impedences to be somewhat close. Here's another interesting point. 10 meters at 1 1/2 wavelengths comes out to 49.43 feet also however it doesn't load worth a damn. What would the impedence be at that? I am hoping that someone has enought spare time and is bored enough to work these out as I don't have access to any programs to calculate these. I am hoping to get a better understanding on why my G%RV loads up and works so well on 20 and 40 meters. Thanks and 73!

Jeff

: >true that digital filters do not suffer from ringing.
: >
: >An analog bandpass filter theoretically rings forever, with an
: >exponentially decay. In practice, the ringing becomes unnoticeable
: >after 2 or 3 time constants (typically a few milliseconds.)

: People should realize that there is a relationship between the
: filter shape (not really the shape factor) and the amount of
: ringing a filter has. The minimum amount of ringing is created
: by using a Gaussian filter response. ...

Another thing many people are confused about is that audio filters do NOT have inherently less ringing than crystal IF filters. The argument is that since the audio filters have lower Q, they ring less. The reason they have lower Q is that they are at a lower frequency -- for the same bandwidth, a lower Q is needed. (Q = F/BW)

The reason most audio filters have less ringing for a given bandwidth is that they have a more nearly Gaussian response. Most IF crystal filter responses have a flat top with steep sides. If you made an audio filter with the same response, it would ring a lot too.

Years ago I made a 200 Hz CW filter for my Heath SB-series receiver. I just tuned it up with a spectrum analyzer / tracking generator until it had a slightly flat top with gently-sloping sides. No noticeable ringing at all, even at high code speeds.

>The entire contents of the North American Callbook is copyrighted by Radio
>Amateur Callbook Inc. The North American Callbook is intended for the
>private non-commercial use of subscribers in sending QSL cards and any other

Well, it isn't as black and white as this would indicate. The Callbook is
a work derived from public domain data (the US Amateur Callsign Database).
The US Amateur Callsign Database may be freely copied, and incorporated
into copyrighted works. At no time can anyone assert copyright over
the US Amateur Callsign Database, though. So, it certainly is copyright
violation to copy a page out of the Callbook, but it is not a violation
of copyright to make a copy of all or part of the US Amateur Callsign
Database. So, if one simply sends someone else information like:

KK6JQ E Dana H. Myers 45129 Biscay St. Lancaster, CA 93535

who is to know where I got it? Did I copy it out of the Callbook
(which is a copyright violation)? Did I copy it out of the Database
I got from the US Govt (not a copyright violation)?

The answer is, you can't tell. People who buy the Callbook are
doing so for convienence. It is very hard to prevent people from
copying the data in the Callbook.

Look what Jeff sez next:

>Are these the same hams that keep claiming they need 100 foot towers with
>no building permits for "emergency" operation? Are these the same hams that
>claim that the ability to send CW with the remains of a microphone cord on

Even the revised version of the manual does not seem complete. There is no
disscussion of the LCD readouts. Most of the displays I was able to figure
out after using the radio a few days but some are still confusing.
It would be nice to have a summary of the LCD indications and what they mean.
Even with the instruction book shortcomings it is a nice radio at a nice price

I have a question....can one go buy a car and drive it off the lot without showing proof of a driver's license? I know I went and test drove a car a month ago...he didn't ask whether I was a licensed driver, or insured.

(Just an analogy for those of you don't see my point)

I wish people would get off radio shack's back. I don't see anyone blaming them for the demise of CB, even though they purport to be America's largest CB dealer. C'mon fellas, it's not Radio Shack, Tandy Corp, or anyone's fault that 2 meters is going down hill. It all revolves around the individual.

Is it the police's fault that some jerk broke in your house? After all, they should have been patrolling your neighborhood, looking for burglars. No, it is not....(well, of course, there could be an exception that some net.ass might figure out and flame me about it...)

2 meters is hell in some places because some jerks choose to make it a hell. There are scum everywhere that posess a flagrant disregard for the law. We need to stop the problem...not a symptom of the problem...
Radio Shack selling 2 meter rigs = choas on 2 meters. NOT!

Get real, people.

The New England QRP Club newsletter, _72_, just carried
this antenna. It's a dowel rod, upon which is wrapped an
HF antenna! Suitable for taking on backpacking trips. You
can use it as a walking stick til you get where you're
going, then hook it up to your QRP rig and work people.

Source record: 281057

A while ago I posted a question about an ATV transmitter that used a Motorola MHW710-2 as a final amp. I asked why the -2 part was used, since a MHW710-1 seemed to be the proper part according to the manufacturer's specs (the -1 part is listed for 400-440 MHz, the -2 for 440-? MHz). The only response I got to the question indicated that the reason was that the -2 is a widely available part, while the -1 is next ot impossible to get if you don't want to order them by lots of 1000.

I have located a source that carries the -1, -2, and -3 parts. The company's name is ALLTRONICS, and they're located in the northern San Jose/Milpitas CA area. Their phone number is (408)943-9773. The cost if $60 each, and they will sell them singly. I don't know about shipping - they're close enough to me to drive to. I haven't bought anything from them (yet), so can't vouch for their service.

Anyone know if $60 is a fair price for these parts?

Source record: 280982

My apologies in advance if this is the "wrong" place to post this.

I have a friend who is a pastor of a Free Methodist church in the Chicago area who is also an amateur radio operator. He has been asked by a group of Free Methodist churches in the Philippines to help them set up a communications network. They are trying to find a pair of 5MHZ tranceivers (about 100W) to be a part of this network. But my friend is having a difficult time trying to find such at a reasonable price in the U.S. because this is a forbidden frequency range here. Also they are trying to get this equipment before May 30 (at least showing a bill of sale) to keep from having to start over the license application process with the Philippine government.

If you know of such, could you please call up my friend (Rev. David Cooper, KA9OZP, Evanston IL [phone 708-328-7182]). Thanks much.

Why can't hams take the responsibility for dealing with illegally licensed
operators? I know that hams have limited authority over the problem, but isn't
it reasonably easy to tell a bootlegger on the local repeater? When ided,
if no one would talk to him or return his call, then the problem is solved.
I get very very nervous when people start involving the government in such
trivial matters. Who can predict where the government will stop? Look at
how they have messed up the firearms issue.

3100. Want 2M/70CM antenna ideas for Caravan

I am just getting started in Ham radio and have a question regarding mobile antennas. I am looking for ideas on what type of mobile dual band (2M/70CM) antenna to use on my Dodge Caravan - given that it must clear a garage door daily (with about 16" clearance). Would a 5/8 wave cowl mount be best or would a bumber/tailgate mount be good. Could anyone with a Caravan/Voyager comment on how they resolved this? I plan on using the antenna for my HT until I buy a dual band mobile rig. Most of my travel is on the plains of South Dakota and Minnesota. Thanks...

>Measured at the transmitter end, the SWR will appear low because
>the relections have been gobbled up by the loss present in coax.
>
>Ed W1AAZ

Ed, As you probably know, "G5RV" is a generic term and doesn't necessarily require coax. I take 84 ft. of open twin-lead directly to the balanced output of my antenna tuner, AS RECOMMENDED BY G5RV HIMSELF. The G5RV has a low angle of radiation on the higher bands, field strength measurements at ground level which are better than a dipole, and four nodes instead of two. So, with the G5RV (no coax), I am putting out as much power in each of four directions as I do with a dipole in each of two directions. Oriented properly, these four directions cover most of the land area of the world. On the higher bands, the G5RV doesn't waste half of its power in high angle radiation like a dipole and doesn't need to be rotated. I have one node aimed at South America, one at Asia, one at Europe/No.Africa, and one at New Zealand. Anyone who doubts the effectiveness of the G5RV's low angle of radiation should perform his/her own field strength measurements vs a dipole.

Reese.Edwards@launchpad.unc.edu (Reese Edwards) writes:
|When a person upgrades from no-code tech to general, is a new call sign
|issued? thanks for your information on this.

If you request one, yes; if you do not, no. It is your choice.

If you request a new one (by checking the box on the Form 610) you will be issued a new call sign appropriate to the general class, which is the same group as the tech class. If you already have a tech class call sign (i.e. you didn't previously upgrade from novice to tech and keep your novice call) you won't change your class. If you currently hold a 1x3 call (say, N4xxx), your new call could even be a 2x3 (KD4xxx) if you are in a district which has run out of 1x3 calls (currently districts 3, 4, 5, and 6, with some others about to run out).

In short you can if you want, but if you already have a tech type call sign you might as well keep it, since generals and techs share the same pool of call signs.

Better check your situation at the door...5MHz as well as 10, 15, 20, 25 and 2.5MHz all all RESERVED BY INTERNATIONAL AGREEMENT to time standard information stations such as WWV, etc. As for finding equipment to run 100w in the region AROUND 5 MHz, that's easy! Most (if not all!) modern amateur transceivers can be modified to add transmit capability in that part of the spectrum.

Your ahem..'friend' had better be very sure he has the proper station licenses from the Philippine government before going on the air though..those people take a very dim view of unlicensed operations...church or not! As for the US, skip it, the FCC does not license churches to operate HF links of the nature you're describing.

Is this going to be a "regular" weekly electronic version
to the info-hams forum? It sure would be welcomed by those
of use that can't hear it on the air.

& Second, I'd like to purchase a better antenna for a 2m HT. Something
& that collapses, like a telescoping whip, would be ideal. I'd also like
& the option to come off the radio at 90 degrees, maybe just using a
& right angle BNC adapter (any potential problems here?). Any
& suggestions for an antenna?

MFJ and AES both make collapsing 1/2 wave 2m antennas. They perform the same (I have both), but the AES as more sections so it folds down a couple inches smaller-it also costs more: $24 vs. $17 (from the last AES catalog).

Diamond makes a rubber duck dual band antenna that is 15" long and works better than the standard rubber duck-especially on 70 cm, but no where near as good as a telescoping antenna on 2m. It is the RH-77B for $30.

& Finally (okay, three questions), MFJ seems to heavily advertise a
& variety of inexpensive antennas and realted gear. Any opinions one way
& or another on their products (specifically or in general)?

Some of their stuff is great: the 2m 1/2 wave telescoping antenna, the standard (not the mini) speaker mike. Other stuff is not so great: I got one of their 3 element 2 meter beams. I thought it would be worth the price if it was well made and came apart/went together quickly. I should have made my own, I had to fabricate a bunch of mounting hardware anyway. It would mount ok for horz polarization, but the stock set up was pathetic for vertical mounting. It is best to get reviews on a product by product basis with MFJ. I have heard complaints on other products also.

In article <1510@arrl.org> root@arrl.org (Jon Bloom, KE3Z) writes:
>This behavior is hardly unique to hams. After seeing the rampant software
>piracy that exists, I long ago concluded that only the prospect of being
>caught keeps most people from holding up banks. Hams are no worse than
>nonhams when it comes to flouting copyright laws.

Actually, what this means is that the public, as a whole, is inclined to
think that the copyright laws are wrong and should be changed.

People behave, as a mass, in the way that they think is right. If
this is contrary to law, then it is the law that is out of step with
society.

This doesn't mean, of course, that anyone who breaks a law automatically
invalidates it. Nor does it mean that because some people are unable to
obey reasonable laws that those laws are invalid. What it DOES mean is
that when you have a large number of people, perhaps even a majority of
the population disobeying a law, it IS time for that law to change.

Prohibition is a glaring example; there are other laws far more mundane.

It's clear to me that the American public doesn't believe that copyright
should apply to so-called "intellectual property" in a lot of ways -
particularly that of making one or two copies of computer disks to give
to friends. They don't feel that it's really "wrong".

The existing copyright laws don't really reflect that attitude. I
expect that, despite the efforts of software publishers to make the laws
even more restrictive, people will continue to make copies for their
friends. Someday the legislators will stop trying to enforce a morality
that the majority of their non-corporate constituency regards as wrong
and those laws will change, but until then, we've got a whole bunch
of people breaking the law.

Luckily, the recent Court ruling that simple arrangements of tabular data
(e.g, the phone book white pages) is without copyright protection frees
a lot of the data that we'd like to use.
- Brian

I have used the ANLI 800 antenna (I believe it is the AL-800 to be exact) with my dual band HT, and I believe it is a great antenna. It makes contact possible where using the rubber duck gets you nothing. I think it was reviewed in a recent QST or like magazine. I have seen one page flyers at the local ham shop about them too. It advertises about 3dB gain on 2m and 4.5dB on 440. These numbers are relatively meaningless, but I can tell you that this antenna works! This is probably the best telescopic antenna you can buy (IMHO), but at $40+ it should be!

73,
KJ5ML

3110. Colorado 14er Radio Event Announcement

Newsgroup: rec.radio.amateur.misc
Date: 1993-05-26 00:52:10 UTC
From: bobw@col.hp.com
Message-ID: <1tuevqINNme9@hp-col.col.hp.com>
Source record: 281069

COLORADO 14ER RADIO EVENT ANNOUNCEMENT

The 1993 Colorado 14er Radio Event will be held Sunday, August 29th. During the event, a group of amateur radio operators will operate portable from the summits of various Colorado 14000 foot mountains. The operating times will be generally from 9 AM to 12 Noon local time. During last year's 14er Event, over 20 summits were on the air and between 150 and 200 different stations were heard that day.

Radio amateurs are encouraged to work as many of the mountaintop stations as possible. However, this is NOT A CONTEST, no points are awarded, no scores recorded. A special event QSL card can be obtained by QSLing to the mountaintop station's home QTH (please include a Self-Addressed Stamped Envelope). To reduce QRM, PLEASE DO NOT USE HIGH POWER (more than 30 Watts) and DO NOT CALL FOR 14er STATIONS UNLESS YOU HEAR THEM.

Radio operators with high altitude hiking experience who wish to participate should contact Bob, KB0CY at (719) 488-0859 or 18070 Sunburst Drive, Monument CO 80132 or via Internet bobw@col.hp.com. To avoid having multiple stations on the same peak, radio amateurs that want to participate must coordinate with KB0CY.

Frequencies used during the event:

146.43 MHz Longs Peak
146.46 San Juan Range (Handies, Redcloud, ...)
146.49 Bierstadt, Grays and Torreys
146.55 Pikes Peak (Coordinating Frequency)
146.58 Mt. Evans
147.42 Sangre de Cristo Range (Humboldt, ...)
147.45 Misquito Range (Quandary, Lincoln, ...)
147.48 Elk Range and North Sawatch Range (Massive, Elbert, Castle, ...)
147.51 Pikes Peak (QSOs)
147.54 South Sawatch Range (Collegiates, ...)
147.57 Reserved for Mountaintop Stations Only

223.5 Primary 222 MHz frequency

446.000 Primary 70 cm frequency
446.025 Alternate 70 cm frequency
446.050 Alternate 70 cm frequency

Other bands/modes: standard calling frequencies

3111. Re: roof mounted tri-band beam

I have my HyGain tribander on a 15 foot high tower section
on the paek of my roof, which is 20 feet over flat ground.
It's very effecctive; I've woked 312 DX countries in 5 years.
A friend of mine has his Mosley on a 10 foot tripod on his roof.
He also gets out quite nicely. 35 to 40 feet is a good height
for a beam, but 55 to 60 is lots better.
I use 4 guys, one to a bolt in each corner of my roof.

Source record: 281073

I have a trip to Italy to join an international conference held in Perugia,
100km from Roma on 27June-3Jul.
If possible, I like to visit contest stations in Italy.
Is there any contester/DXer in Prugia, or near Roma ??
Or, any physist who attends the conference named "PANIC 93" ??
Please e-mail me.

Ohio/Penn DX Bulletin No. 112

The Ohio/Penn Dx PacketCluster
DX Bulletin No. 112
BID: $OPDX.112
May 24, 1993
Editor Tedd Mirgliotta, KB8NW
Provided by BARF-80 BBS Cleveland, Ohio
Online at 216-237-8208 14400/9600/2400/1200/300 8/N/1

Thanks to the Northern Ohio Amateur Radio Society, Northern Ohio DX Association, Ohio/Penn PacketCluster Network, ARRL, DXAC, DF4RD, EA3BKI, HB9ARC, AD1C, K3ANS, K4CEF & Southeastern Cluster Group, AH6MM, KF8VW, W8GMH and NE8Z for the following DX information.

9M0S, SPRATLY ISLANDS. Martti Laine, OH2BH, was heard talking to Wayne, N7NG, this past weekend about the latest details of the 9M0S DXpedition. The DXpedition team (OH2BH, N7NG, OH1NYP, OH2MAK, AB6NJ, WA6AUE, JA5DQH, 9V1YW, 9M2FK and 9M6TC) plan to depart from East Malaysia by plane and fly directly to Spratly. Departure time is 7 AM from 9M6-land on May 27th. It is only a one and one-half hour flight to Spratly, so they plan to be on the air in the afternoon. Operation will last 6 1/2 days.

CW: 1827, 3502/3522, 7002/7022, 10102, 14022, 18072, 21022, 24892, 28022 kHz
SSB: 1827, 3792, 7062, 14195, 18102, 21295, 24932, 28495 kHz

The satellite operations are supported by the U.S. OSCAR 13 Group and maintained by OH2MAK. During the CQ WPX CW Contest stations will be transmitting 1kHz above CW band edges.

9E, ERITREA. There is a rumor that two JA operations are planned for here towards the end of month. Call signs are apparently already assigned, but the operators do not wish to publicize them.

IOTA NA-110. Dr. Rick Dorsch will be active as NE8Z/1C0 from Hilton Head Island, South Carolina. Activity will be from June 19-27, on the following frequencies: SSB IOTA freq 14260, 21260 and 28460; CW is plus 5kHz and 25 kHz up on 40-10 meters. QSL Manager is K8LJG, John Kroll, 3528 Craig Drive, Flint, MI 48506.

KH9, WAKE ISLAND. The following information was supplied by Javier, AH6MM, about a DXpedition that is still "IN THE WORKS": The Cal Poly Amateur Radio CLUB W6BHZ (ITS STUDENT MEMBERS) are organizing a DXpedition/Radio Wave Propagation experiment to WAKE ISLAND KH9 for late August and early

September. Permission has been received from "some" of the necessary U.S. AIR FORCE authorities. This is being organized as a "MAJOR" DXpedition and Propagation Experiments to KH9 by the students of California Polytechnic State University and the Cal Poly Amateur Radio Club W6BHZ. There will be 6 operators and activity will be on CW, SSB, RTTY and OSCAR Satellites and all bands (160-6 meters). MOONBOUNCE equipment might be brought if enough funds are received to get equipment to WAKE (This is being done on a college student budget so they might need help). This is "UNOFFICIAL INFORMATION", but they expect the last remaining documents to be received in the next 2 to 3 weeks. More details and information will be released later as it is received. Also, Javier, mentioned he will be working and operating in Finland this summer (more details next week).

KH0, SAIPAN. Dave, KE2PF, will be active before the end of the month from here and other remotely islands. The remotely islands, which consist of Sarigan Island, Pagan Island, Maug Island, Guguan Island and Aguijan Island, will please many IOTA chasers because they have never been on the air before. He plans to spend a day or so on each island.

S0, WESTERN SAHARA. OPDX has obtained two letters from Arseli Echeguren Bardeci, EA2JG (R.A.S.D Amateur Manager), stating that portable S0 operations are not allowed at the present time in the country. The station operating KA3KJH/S0 has not received any permission to operate portable S0. The one letter also states KA3KJH/S0 is not operating inside S0 territory. At the present time, the only legal active stations of operation are: S0RASD (Club Station), S01A (Naama Zeine Edinne), S01B (Azman Mohammed) and S01MZ (Manfud Zein). The only temporary operations and DXpeditions that were legal are: S01EA, S01LYNX, S02UN, S03UN and S01DX. Both letters were orginally sent to the ARRL in March.

T2, TUVALU. Juan, T20JC, is apparently a new licensee on the island. He has been heard a few times on 14247 kHz between 0330-0500z. It was reported that Juan is with the Peace Corps. QSL via KL7H.

V6, MICRONESIA. Greta, HB9ARC, attending the Asian YL-meeting in Osaka, met with Minami, JQ3EEL, and was told he would be going to Micronesia as V63SM, June 18-20. He will be active on SSB (21240, 7070), CW (21040, 7007) and on the satellites (145.930 or 145.890). QSL to: P.O. Box 88, Moriguci, 570, Japan.

ZD9, TRISTAN DE CUNHA AND GOUGH ISLAND. Andy, ZD9BV, and his wife Lorraine, ZD9CO, are the only hams on Tristan de Cunha. They can only operate until midnight local time because the town's generator goes off at that time. Andy frequents 21260 kHz around 1830z and 21313 kHz at 1800z. His wife sometimes shows on the YL/NET at 21313 kHz around 1830z and another net on 21355 kHz at 1930z. Both can be QSLed to W4FRU. Alain, ZD9CQ, is on Gough Island through November. He mainly works 20 and 40 meters on SSB. QSL via ZS6AS.

DXAC HAPPENINGS. Reported in the DXAC's Monthly Report, the DXAC Chairman Bob Beatty, W4VQ, has scheduled two votes for the week of July 5th:

1) The DXAC was requested to consider an endorsement for the DXCC award
for those attaining Honor Roll status for single-band and
mode-peculiar endorseable DXCC awards.
2) The Southern California DX Club proposes a change of DXCC in Criteria
Point 2 from a separation between a Point 1 island nation and the
first island from 225 miles to a separation of 100 miles and from
the first island to subseqents islands of 500 miles to 100 miles.
The intent is to "increase the number of countries for the pursuit
of DX".

NEW CALL SIGN PREFIXES FOR "The Commonwealth of Independent States (CIS)"
as reported by the Russian newspaper, "Patriot".

4J - Azerbaydzhan EY - Tadzhikistan
4L - Georgia EZ - Turkmeniya
EK - Armenia R, UA to UI, 4K - Russia
ER - Moldova UJ to UM, UR to UZ, EM, EO - Ukraine
EU, EV, EW - Belarus UN, UO, UP, UQ - Kazakhstan
EX - Kyrgyzstan

Uzbekistan was missing from the list. There was no indication of
implementation dates nor what would be the status of current call
signs that do not conform to this outline.

FAX YOUR DX INFORMATION NOW! Faxing is available Monday/Wednesday/Friday
from 0430 to 2330z only. The number is 216-237-8208 and operates Group 3
FAX Service Class 2 (EIA/TIA 592) only. Use only the dates and times
specified. FAX Service Class 1 (EIA/TIA 578) is availble upon request by
leaving a message to the Sysop on BARF-80 BBS. The FAX card is sharing
the same phone line as BARF-80 BBS using a data/fax/phone switch.

Excerpts and distribution of The OPDX Bulletin are granted as long as
OPDX/BARF80 receive credit. To contribute DX info, call BARF-80 BBS
online at 216-237-8208 14400/9600/2400/1200/300 and leave a message with

>reasonable plan?

It's not ideal. :-) Though it may be workable. I'd suggest, however,
not splitting the feedline between open wire and coax if you can't
adhere to lengths where this is an advantage. You may pick up unwanted
resonances that will make the antenna difficult to match at certain
frequencies. A very low or very high terminal impedance can occur
when the antenna or feedline is resonant. This can be difficult to
match.

A classic antenna that is not resonant at any of the ham bands is
a 105 foot flattop fed at the center by either open wire line or
high quality coax and used with a good wide range tuner. This
arrangement will offer impedances that a tuner can deal with on
all the major HF bands. It may be necessary to adjust the length
of the feedline to avoid resonant lengths in order for the tuner
to be most effective at certain frequencies. I've found a 70 foot
feeder to work well on all bands.

> we get in EMA going to preclude this idea?

People do this, using either a roof tripod or a short roof tower, like the one from Texas Towers. However, it's not the best idea for several reasons. A mundane reason is wind noise. The roof mount will couple wind noise into the house. In one installation I've seen, a steady wind caused a loud "moaning" in the house as the antenna excited a resonance in the structure. Less mundane reasons are the overturning force generated by the sideloads imposed by wind on the antenna and mast, and the possibility of leaks caused by the rocking mast.

If we assume a 5 sq-ft wind resistance by the antenna and a 20 foot rooftop tower, then at 70 MPH the sideload torque on the roof will be about 64,000 foot pounds. With a 1 foot square base, that puts about 445 PSI stress on the roof attachment point. You'll have to beef up the roof and/or add guys to spread the load. Otherwise, the antenna and tower will rip your roof off.

You can reduce the sideload torque by using a shorter mast. A 5 footer would reduce the torque to about 13,000 foot pounds. But that will bring the roof close enough to the antenna to badly affect it's pattern. A freestanding tower, perhaps with a house bracket, is a cleaner solution.

A quick formula that will convert antenna wind resistance to pounds force is 0.13222*A*V^2 with A being the antenna area in sq ft and V being wind speed in MPH. To get overturning torque, multiply this force by the tower height in feet.

I've discovered that you don't always need to provide the source!

If you use a sensitive SSB receiver, you can often use the noise
coming out of many buildings as a noise source! Its often pretty
broadband so you can easily test a variety of frequencies. Of
course, there are often multiple sources that may interfere with
each other. But, you should be able to move the antenna to
a slightly different location and determine whether there is
a problem or not. I've actually done this a few times and it
works quite well for confirming that a good design is indeed working.
On the other hand, if you don't know where the sources are yet and
your antenna has a trashy pattern, you might end up terribly confused.

But, if you already have a SSB receiver, how much cheaper can you get?

Warning: Not all buildings are suitable for this purpose....
First choice would be someplace you work you or go to school,
unless you can't tell people where you work :-).

Like any purely tabular collection of publicly available data, the ARRL
repeater directory is only copyright in it's form, not it's content.
The information in the directory comes from coordinating bodies and
individual repeater owners voluntarily supplying the information for
public dissemination.

The fact that the FCC views it inappropriately as a "national repeater
database" is unfortunate, and gives the League publication clout all out
of proportion to it's actual utility. This came to a head during the
debate over 220-222 MHz when the FCC cited the directory as the authoritative
source for amateur activity in the band even though the directory is only
an incomplete and inaccurate representation of repeater activity and
not a mapping of actual amateur usage.

3123. DX-390; mods to make it not wrap on band boundaries?

Newsgroup: rec.radio.amateur.misc
Date: 1993-05-26 06:24:44 UTC
From: cgw@unt.edu
Message-ID: <cgw.738397484@sol>
Source record: 280988
Cross-posted to: rec.radio.shortwave,rec.radio.amateur.misc

Is it possible to modify a DX-390 so that it won't keep wrapping around
and around the two ends of a particular band in 'search' mode? I find
this feature only slightly useful, but it would be better, IMHO, if
a search would go from 1.711 MHz all the way up to 29.999 (stopping,
of course, on any strong signal).

email replies would be welcome, as I don't read this group often.

<mwiz@austin.ibm.com> asks:

> What kind of charger does it take to charge these batteries? Can one use
> an existing rapid charger?

You can use any existing nicad charger. The NiMH cells are supposedly happiest with a 110 mA chaarge current, but can deal with anything from zero to 300+ mA. Most "rapid" chargers supply 150-200 mA; this should work.

(Notice I say "should." As yet, I have no hard experience with these cells one way or another; the above, and my earlier comments, are based on specifications supplied by the manufacturer. As I mentioned, I'm waiting for a shipment of NiMH cells, and will report on their performance and characteristics presently. Stay tuned. :-)

>power and SWR measurment and tuning? I'd like to keep things on the
>cheap side...

There are four parameters of interest for effective antennas, the pattern, radiation efficiency, mechanical feasibility, and relative ease of matching. Of the four, the first three are paramount. Therefore VSWR measuring equipment should be at the bottom of your list of test equipment.

Your primary tools should be an antenna range relatively free of confounding obstructions, a reference dipole, and field strength measuring equipment. With these, you can judge the relative effectiveness of your designs. A directional power meter is useful only in determining coupling adjustments to your transmission equipment so as not to confound measurements relative to your reference antenna. Remember, a good dummy load has a VSWR of 1:1, but that doesn't make it a good antenna.

In many cases it's simpler if you test your antenna by receiving a reference weak source rather than trying to test it as a transmitting antenna. Since most good antenna designs are reciprocal, this will give similar results. A step attenuator and a receiver with a signal strength indicator are the only essential tools.

>Second, I'd like to purchase a better antenna for a 2m HT. Something
>that collapses, like a telescoping whip, would be ideal. I'd also like
>the option to come off the radio at 90 degrees, maybe just using a
>right angle BNC adapter (any potential problems here?). Any
>suggestions for an antenna?

Both AEA and MFJ, among others, make collapsible antennas for 2m HTs. They are, of course, much more delicate than flexible antennas. Larsen, Comet, and others make superior flexible antennas that will perform much better than the typical rubber dummy load supplied by the HT manufacturers. Of course they are larger since small and efficient are mutually exclusive. Simply attaching a 19 inch wire to the shell of the BNC connector of the HT and letting it trail down while in use will substantially improve the performance of any HT regardless of antenna in use (aside from remotely mounted antennas of course).

>Finally (okay, three questions), MFJ seems to heavily advertise a
>variety of inexpensive antennas and realted gear. Any opinions one way

>or another on their products (specifically or in general)?

Some MFJ stuff is good, some is junk, and manufacturing quality varies widely. Pricing is generally low and you get what you pay for. That's not necessarily bad if you are willing to put in some effort to overcome their manufacturing deficiencies.

I heard that NiMH is more sensitive and damaging to over charging, what
kind of charger can detect it? Only solution now is to drain it all, and
time it with current multiply (still need efficiency factor for heat diss.)
But it defeats one of the reasons of NiMH, being able to be charged at
any time and no memory effect. (now NiCd memory effect is debatible, and
many people said it is mild only was exaggerated by myth)

>(Notice I say "should." As yet, I have no hard experience with these cells
>one way or another; the above, and my earlier comments, are based on
>specifications supplied by the manufacturer. As I mentioned, I'm waiting
>for a shipment of NiMH cells, and will report on their performance and

Where do you buy them? How much? The May 93 issue of the Japanese CQ ham
radio magazine has an article about it, this one is made by Green Power,
which is the brand you buy NiCd in Supermarket shelves. They also have some
stores' ads showing it . Another sidekick, a full page ad by Fuji, selling
their Lithium cells in AA size, didn't say what voltage though. (should be
3V if same chemicals as other Lithium).
The GP NiMH shows 1.2AH on AA size, and was tested on a Standard C550
HT, the TX power vs. time curve shows that it actually last longer than
the 850mAH NiCd AA, and the trailing curve is not as sharp as NiCd.
From guessing Kanji (I know Chinese, which Kanji stole the chars from),
I could guess they said they bought the cells from Hong Kong (where I
am from, and I don't know Japanese, except guessing Kanji).
BTW, it's on p. 358 in case you are going to a Japanese bookstore to check
it out.

3128. VK2WI Weekly News, 16th May 1993

Newsgroup: rec.radio.amateur.misc
Date: 1993-05-26 09:09:48 UTC
From: dave@eram.esi.COM.AU
Message-ID: <3973@eram.esi.COM.AU>
Source record: 280998
Cross-posted to: rec.radio.amateur.misc,aus.radio,rec.radio.info

[These snippets were gleaned from the packet radio network; they appear to be the only machine-readable record of the VK2WI Broadcast now.]

Two Kenwood rigs won in WIA membership campaign.

The Prizes for the WIA NSW Divion's membership recruitment and retention campaign were drawn by Mr Joshua Mui of Kenwood at the Division's annual general meeting on Sunday 9th May.

Second prize of a Kenwood TH-28A two mwtre handheld treansceiver was won by Mr N.F. Black VK2TNB of Blakehurst.

First prize of a TM-732A dual-band two metre/70 cm rig was won by Mr J.H. Willmott VK2AJX, from Bowral.

The promotion campaign achieved it's purpose. The goal was to boost membership by recruiting new members and retaining existing members where, in recent years, membership has been falling. The target was a net gain of 100 members.

By the end of the promotion, conducted over December last year through February this year, membership had risen by a total of 102 members above forecast. The NSW Division now has the highest membership of all Divisions, standing at 1714 as at the end of March.

Space News.

The French Arsene satellite was successfully launched from the Korou space centre in French Guiana on Wednesday, May 12.

However, disappointingly, it seems to have suffered a serious failure, according to a report dated May 13.

Jean Gruau. F8ZS, President of the Radio Amateur Club de L'espace, said: "a signal is coming from Arsene, but it is extremely weak and not serviceable."

It was speculated the problem could be improper antenna orientation or a power system failure.

Astra, the commercial satellite that was launced with Arsene, is functioning normally.

Amateur radio publicity dispells the myths.

A story on page 15 of the Sydney Morning Herald for Saturday 15 May should go a long way towards correcting public perceptions of radio amateurs as cranks who listen to crackly transmissions on shortwave

between bouts of eavesdropping on salacious royal phone calls.

The article explains how John Simon VK2XGJ was awaiting news of the launch of the latest packet radio satellite, Arsene.

Written by Herald staff journalist, Richard Macey, the article is accompanied by a picture of John in his "shack". A keyboard and computer monitor are in prominent view among the transceivers, but there's not a microphone in sight!

Macey clearly explains packet radio in laymen's terms, after telling readers that "amateur radio enthusiasts have come a long way since the days of huddling over crackling wirelesses..."

International News

The US government plans to auction two large segments of the radio spectrum between 1.8 and 2.2 Gigahertz (GHz).

The auction scheme is apparently part of a plan to cut the government's budget deficit.

The auctions have been approved by a committee of the congress, while companion plans are passing through the US senate.

President Clinton approves the auctions shceme, which practically guarantees they will be passed, according to reports.

The auctions are forecast to return some seven billion dollars U.S. to the American government.

New Divisional Council elected.

Elections for the 1993-94 Council of the WIA NSW Division saw the following candidates elected:

Sandy Brucesmith VK2AD

Roger Harrison VK2ZTB

Roger Henley VK2ZIG

Julie Kentwell VK2XBR

Bob Lloyd-Jones VK2YEL

Tim Mills VK2ZTM

Erich Reimann VK2WH

John Robinson VK2XY

and

Terry Ryeland VK2UX

In article <9305260335.AA06855@slc4.INS.CWRU.Edu>, aq474@cleveland.Freenet.Edu
(Tedd Mirgliotta) says:
>NEW CALL SIGN PREFIXES FOR "The Commonwealth of Independent States (CIS)"
>as reported by the Russian newspaper, "Patriot".
>
> 4J - Azerbaydzhan EY - Tadzhikistan
^^^^^^^^^^^^^^^^^
> 4L - Georgia EZ - Turkmeniya
> EK - Armenia R, UA to UI, 4K - Russia
^^^^^^^^^^^^
> ER - Moldova UJ to UM, UR to UZ, EM, EO - Ukraine
> EU, EV, EW - Belarus UN, UO, UP, UQ - Kazakhstan
> EX - Kyrgyzstan

It was just announced in Germany that the ITU allocated
4JA-4JZ a n d 4KA-4KZ to Azerbaidjan. So Russia will have
to do something about their 4K (Antarctica and Arctic islands)
and 4J (Maly Vysotsky I.) prefixes in the future.
UN is already in use by Kazakhstan along with the old UL which
will be phased out by the end of the year.
4J and 4L for Azerbaijan and Georgia are widely used.
Also Armenia has been heard using EK.
Others observed in correct use recently (but obviously special
stations only) were EO for Ukraine and EU and EV for Belarus.
Tadzhikistan is still active as UJ (e.g. UJ8JI).

3130. Some advice on soldering coaxial cable

Newsgroup: rec.radio.amateur.misc
Date: 1993-05-26 11:28:00 UTC
From: stocker@nssdca.gsfc.nasa.gov
Message-ID: <26MAY199307284866@nssdca.gsfc.nasa.gov>
Source record: 281001

If someone could take the time to email me some advice on soldering connectors onto coaxial cable I would appreciate it.

I know how to prepare the cable for soldering and know to tin the shielding before soldering. However, I have the following specific areas that I would like to get someone's opinion who has done a bunch of this type of soldering:

1) Will a 35W iron be enough to heat both the connector and the shielding so that the solder will flow well.

2) Is there an easy way to tell when the connector is hot enough before the insulation starts to "flow"

3) I had someone tell me that I shouldn't attempt to flow solder in all the solder holes on the connector for the shielding. Is there a minimum number that must be soldered.

Thanks for any advise you can pass on.

Well naturally, the charging current depends upon the capacity of the cells.
For NiCd cells the standard rate is C/10 (or 100mA for a 1 Amp-Hr cell).
I agree that the most common cell used on hobbying is probably near 1 Amp-Hr
but, just thought we should be more general here.

3132. Anyone have BD distance calc?

Newsgroup: rec.radio.amateur.misc
Date: 1993-05-26 12:16:33 UTC
From: MOWE%SLUMUS.BITNET@cunyvm.cuny.edu
Message-ID: <26MAY93.08938158.0010.MUSIC@SLUMUS>
Source record: 281004

In a recent posting, Bob Weir (WB5KXH) asked about the
availability of BD, the high-accuracy bearing & distance
program.

Along with Paul Wade, N1BWT, I'm the author of BD. I'll be
happy to e-mail the source code to anyone who wants it. You'll
need Turbo Pascal to compile it, however. If you want the
executable file (plus source), write to Emil, W3EP. Include
a disk w/postage or a few bucks.

Source record: 281003

I use a Larsen dual-band antenna mounted using an "L" bracket on the driver-side right fender. Another Caravan-owning ham I know uses a small dual-band (diamond? about 8" long) antenna mounted with a whole drilled in the roof. I rejected that idea cuz I wanted to put large things on the roof-top luggage carrier.

I've tried brand new Gold Peak 1100 mAH NiMH cells using a variety of
slow and fast chargers, including the NiCD circuit in a couple of scanners.
No go. You get about 300 mAH out of them, and they self-discharge in a
few days.

> accurate formula to calculate earth distances is
> now available in the public domain for noncommercial
> purposes (Page 96). I't called BD (Bearing and Distance).
> Anyone know where to get it from the net?

I am led to believe that the results from "BD" may not be much different
from the oblate-spheroid earth model used in the "World Above 50 MHz" distance
calculations for the past 15 years or so. The earlier model was furnished by
Dick Allen, W5SXD. Maybe he could help you. It would be interesting if
someone could post a comparison of the results.

From: rogerm@fc.hp.com
Message-ID: <C7Myv9.6Av@fc.hp.com>
Source record: 280724

I just saw an ad in the latest J.C. Whitney catalog for a 2 meter HT with 20 memories and access to over 4000 channels for $379. Nowhere in the add did it mention that an FCC license was required for operation. At least Radio Shack says that an FCC license is required to allow the legal use of their amateur radio equipment.

Don't know if you have seen the manual or the box for the
HTX-202, but both have very prominently in several places
"Note: You must have a Technician Class or higher Amateru Radio
Operatior's License and a call sign issued by the FCC to legally
transmit. Transmitting without a license carries heavy penalties."

We even emphasize the requirement for a license in our Business Band
transceivers, GMRS transceivers, and 170-MHz microphones. Several
times a year we include this information in our Merchandising
Newsletter -- that goes to all stores.

Again, however, case law (i.e. someone got sued and lost) prohibits
us from requiring a person to have a license before they can
purchase a license-required rig. We only refuse to sell if someone

I've seen several other postings that also indicate you must pass one exam
element before you can take the next. This *USED TO BE THE CASE* but it
is no longer true! The FCC doesn't care what order you take, or pass the
exam elements in. They only care that you pass the necessary elements
for a particular license. So, for example, if the Novice takes and passes
elements 1C, 3A, 3B and 4B, but fails the 4A exam, the candidate ends up
with a General license, until he or she later passes the Element 4A exam,
at which point they end up with an Amateur Extra license.

The sixth edition of the ARRL/VEC Volunteer Examiner Manual addresses this,
by saying, "At the team's discretion, elements may be administered out of
order." (page 55) Unfortunately (at least IMHO) the manual also states,
"we would still recommend that the examinee must first retake the failed
element and pass it before proceeding to take a higher examination element."

(page 51)

Notice there is *NO* regulatory basis for this "recommendation" and if a candidate goes into a session feeling prepared to take all the written exams, I see no reason they should not continue even though they do not pass an earlier element. This will allow them to concentrate later on the element they still need to pass, and will also give them the test-taking experience. The final decision does rest with the Volunteer Examining Team, however.

>grid volts 37.5 screen volts 250 plate current 50 mA Screen current
>6.6 mA)

This isn't really a very good tube for audio work, but you often see them
used in PA amplifiers, AM modulator stages, and the like. The low-level
nonlinearity is a bit of a problem.

At RF, though, it's not half bad. It's got a low enough internal capacitance
that it does a good job for low power operation. I wouldn't hesitate using
it in new designs.

>such as WWV, etc.

Uh, if someone were to ask about a "30 meter" amateur transceiver, would you
post a similar flame on the grounds that 9.999MHz is not part of an amateur
band?

>As for finding equipment to run 100w in the region AROUND 5 MHz,
>that's easy! Most (if not all!) modern amateur transceivers can be modified
>to add
>transmit capability in that part of the spectrum.

Something else they may need to worry about: if the Philippine equivalent of
the FCC has a "type-acceptance" criteria for equipment, they may find it
illegal to operate equipment which hasn't been purchased from a local dealer
and which isn't from a manufacturer that has paid the necessary bribes.

3149. nec2.in.c problems

Newsgroup: rec.radio.amateur.misc
Date: 1993-05-26 15:10:45 UTC
From: mwm@hasler.ascom.ch
Message-ID: <1993May26.151045.9690@hasler.ascom.ch>
Source record: 281013

This share archive contains a corrected makefile for nec2.in.c.

There have been 4 problems reported.

1. The makefile looks for n.c n.o and n.f - these have been renamed nec2.c nec2.o and nec2.f
Use the makefile in this posting.

2. Can't write output files but will output to the screen.
Fortran 77 only supports 2 file modes old and new. An "old" file must
exist and a "new" file must not exist. It will not overwrite an existing file.
The output files included in the distribution have the same names as the
test case output files so fortran77 will not write over them. With
this Makefile type "make saveit" and it will move the sample output
files to a new name.

"make test " will then build nec2 and run the test cases and diff them
with the sample results.

3. Missing math routines on some machines. Included in the original distribution
were the fortran math routines not in the sun math library. On the RS/6000
some additional routines are needed. They are included here. You will need
to update the makefile adding the routines. All these and more are contained
in the f2c distribution available from any gnu site or research.att.com.

4. Warning message in compile about a line of code that is not reached. Just ignore the warning.

Another problem I have noticed using gcc on a 68k machine. If optimization is on the program
will fail. I have had other problems with gcc on a 68k based machine.

3150. Ic-251A interface to G3RUH 9600 baud modem help.

Newsgroup: rec.radio.amateur.misc
Date: 1993-05-26 15:28:54 UTC
From: ae517@Freenet.carleton.ca
Message-ID: <C7n4C6.B7C@freenet.carleton.ca>
Source record: 281015

Does anyone know the details for interfacing the G3RUH 9600 baud
modem to the Ic-251A all-mode transceiver? I have found the
discriminator point, and am reasonably sure I know where to
connect the txd to the fm reactance modulator, but why re-
invent the wheel? Also, when I do get this puppy up and running,
what would be the rx/tx swtiching time of the rig so I can
set up my parms?
tnx in advance de ve3uav

>
For those of you who are not familiar with the ANLI 800 kit:

It comes in three parts:

1. A coil encased in a plastic cylinder with a BNC on one end and a
threaded stud on the other end.
2. A three inch long flexible whip that threads on the end of the coil
3. A 2 1/2' telecopic whip that also thread on at the end of the coil.
This is 1/2 w on 2m and 2 stacked 5/8 w on 440.
It is light and seems to not too stressful for the HT.

So you can use either the flexible whip or the telescopic antenna with the
coil connector assembly.

I purhcased it at Dayton for $36 and did some tests with a friend in the
HARA arena while I was in a parking lot about a mile away. We did these
tests in the 70cm band.

Reports:
The ICOM FL1443B (? - the whip that comes with a W2A - reportedly a good
one). Noisy and signal was not strong enough to override the other
signals.
The ANLI 800 flexible whip - Full Queiting.
The ANLI 800 telescopic whip - Full Queiting.

I have no connection with ANLI except that my HT is connected to an
ANLI 800 antenna and I like it. I do not use the ICOM antenna any more.
I usually keep the ANLI800 flexible whip on the HT.

I would like to thank all the people who have responded so far with
follow up posts here.

I have been accused of claiming to be an expert (among other things).
I made no such claim(s). In fact at the outset, I stated (clearly I thought)
that what I was expressing were personal opinions on the subject. Obviously
I had hoped for some response or I never would have made my opinions public.

For what it's worth, I am currently wrapping all the answers into a
file and will be sitting down with a copyright lawyer to go over the issues.
Afterwards I will be posting the comments from that discussion here as well.

73 es GM from Jeff, wa6fwi

P.S. Mark, tell you wife thanks for the wonderful party posting.

In article <9305241532.AA03807@ginzo.wellfleet> ginsburg@ginzo.wellfleet.COM (Scott Ginsburg) writes:
>
>I'm interested in getting a tri-band beam (maybe something like a Cushcraft >A3S) up in the air without putting up a tower. I've heard of people roof >mounting such antennas, and am looking for advice from those that have either >done it or have researched it and decided it's a bad idea.

I bought an A3 and HamIV rotor from a YL who had it up on a one-story on a 4-foot (5-foot?) tripod. I've bought a 9-foot Rohn tripod to use on the top of my 3-story house (My wife said I can't have a tower but she doesn't know what a 9' tripod is going to look like (-: (-:). I hope to put it all up this spring. I'll be a little cramped for guying opportunities but I definitely am going to go the route suggested in the ARRL books of going through the roof boards with a long carriage bolt to a backing board across the roof joists. Nothing this big can hold onto the roof boards without ripping both off the roof! I'll have to give up a little on mounting the tripod close to the edge of the house in order to get the angle to put up guys, but I think it'll be the better choice in the long run.

No practical advice, then, just untested opinion (-:.

3155. Want copy of SJ Resolution 90 7-May-93

Newsgroup: rec.radio.amateur.misc
Date: 1993-05-26 17:05:34 UTC
From: dale@sequent.com
Message-ID: <1993May26.170534.873@sequent.com>
Source record: 280882

I am looking for a copy of Senate Joint Resolution 90 which
was released May 7, 1993.

This document says good things about ham radio, and I want a
copy to include with information for some local county commissioners
as well as for my files. We are having some serious problems with
local land use regulation.

Perhaps ARRL will grab a copy and run in a future QST. If anyone
has a copy please let me know. Anyone with good OCR software should
scan it and get it on the next QRZ ROM. In fact I'd like a directory
of such things on the next QRZ ROM.

73, Dale.

3156. GFCI tester

Newsgroup: rec.radio.amateur.misc
Date: 1993-05-26 17:26:55 UTC
From: wa2ise@netcom.com
Message-ID: <wa2iseC7n9sx.Dxt@netcom.com>
Source record: 281014
Cross-posted to: sci.electronics,rec.radio.amateur.misc

You can wire a power plug (3 prongs) with a 15K 2W resistor and a push button switch to create a GFCI outlet tester. connect resistor to ground pin and other end to the normally open on the switch, and the common on the switch to the hot powerline pin on the plug. I found an incorrectly wired GFCI in the bathroom of my apartment. The test button in the GFCI would pop, but the power didn't get switched off. The above plug in tester will find such errors. Turns out that the GFCI had the load and line connections backwards. The line leads pass thru a toroid, and a circuit looks for a mismatch of current on the hot and neutral wires. More current on the hot than neutral may mean someone's getting zapped (current from hot thru person to grounded plumming) and cut power fast! using a relay. GFCI's have a load connection so you can daisy chain additional outlets downstream and have protection on those regular outlets. But if you get the line and load connections backwards, you'll protect the downstream outlets, but the GFCI outlet will stay hot when it goes into protect mode. Just pressing "Test monthly" button to see if "reset" pops will not find this error, unless you have a radio on or something connected to the GFCI.

>
>
Not sure I understand what could happen to static ram? It loses its memory
when power is off anyway? Don't know how NVRAM works, but assume that it
must be something like eeproms, or perhaps ram that retains its memory via
capacititive static charge. I had allways assumed that freqs were
stored in HTs using eeproms, but perhaps another technology is used, if so,
how does it work. My wife carried her HT on a plane once, and sent it through
the x-ray conveyer. When she tried to use it (once off the plane), it was
totally messed up! It still had the freqs programmed in, but it was
locked into transmit mode, yet not transmitting, could not receive anything
on any freq (not even static if I remember what she told me correctly).
She had to reset the rig (func on)(this was an Alinco 580), and then it
worked OK. Anyway, it seems like the x-rays zapped something, but it seems
like they hit something other than the freq memory, and whatever it was, it
was restored by the reset. This sounds like they store something other
than freq/offset/etc data in the non volatile memory for some reason?

My guess would be that it probably has something to do with your "Blue Laws" that have all kinds of crazy things that you can't sell on Sundays (for instance, you can buy a turkey, but you can't buy a pan to cook it in, you can buy a gun but not a Bible on Sunday, and so on). I don't recall which catagory calendars fall into.

Glad I only spent two years in Dallas, and also glad I moved away a dozen years ago! ;-) ;-) ;-)

73,
Clark

From: jherndo@eis.calstate.edu
Message-ID: <C7nJJo.HAr@eis.calstate.edu>
Source record: 280880

I'm looking to find out which NOAA satellites are currently functioning
(as far as sending down transmissions of satellite views) and what
frequencies are they using.

Also, which satellites use APT to send data? What are their frequencies?

Any other freqs. or sat information would be greatly appreciated!

Oh, also.. are there any satellite tracking programs that can track
multiple satellites at once?

dorsey@lila.com (Bill Dorsey) writes:
> I need to know the touch tone frequencies corresponding to the digits
> 0-9 and A-D for a project. Can anyone tell me what they are?

1 700 Hz + 900 Hz
2 700 Hz + 1100 Hz
3 900 Hz + 1100 Hz
4 700 Hz + 1300 Hz
5 900 Hz + 1300 Hz
6 1100 Hz + 1300 Hz
7 700 Hz + 1500 Hz
8 900 Hz + 1500 Hz
9 1100 Hz + 1500 Hz
0 1300 Hz + 1500 Hz

Now, you need to combine these two freqs, to get the one. I don't meed
add them mathematically. You need to blow both freqs. together to
generate the single tone. Unfortunately, I don't have any kind of quick
ref. to the A B C D tones. But I'm sure someone does.. Send me mail if

Can you run MININEC or NEC-2? Either one will immediately give you the answer to your first question with minimal effort, i.e. what is the antenna's impedance. To calculate the impedance seen by the transmitter, you need to use a Smith chart or something similar to determine the impedance transformation performed by the feed line. Another way to determine the load seen by the transmitter is to treat the feed line as a series transformer and apply the formulas from the ARRL Antenna Book to calculate what the antenna system's impedance is.

There will be a Canadian HQ station operating in this year's contest.
The Radio Amateurs of Canada (an amalgamation of the former Canadian Amateur
Radio Federation and the Canadian Radio Relay League) has authorized station
VE5VCA to be the IARU HQ station. This will be a multi-single effort, all bands,
so watch for VE5VCA giving out "59(9) RAC" from Saskatoon, SK.

I believe the problem is with *rapid*, high-current overcharging, which
causes adverse heat buildup in the cells. (NiMH cells have a higher
internal resistance than nicads, hence dissipate more power as heat.)
As far as I know, NiMH's are not easily damaged by low-current (trickle)
overcharging.

As for a charging efficiency factor, this is one of the things I'll have to
investigate in the course of converting my scanner to NiMH power; I'll post
whatever insights I gain...

NiMH's are now available in AA and C cell sizes from:

Harding Energy Systems
826 Washington Avenue
Grand Haven, MI 49417
phone (616) 798-7033

Prices for AA's are $6 per cell with solder tabs, or $5 each without, and $5 for shipping. ($5 should cover shipping a fair number of AA cells.)

Harding sells only to individuals--no dealers so far--and takes either cash or COD's. (No credit cards. :-( )

These AA's are 1100 mAh, by the way.

The Fuji lithium AA's are, believe it or not, 1.5 V. It's some sort of a hack on the normal lithium chemistry, which ordinarily yields 3V as you mention. As disposables go, this is one helluva battery, both in terms of capacity and shelf life.

Source record: 280898

I don't own a Zyxel. But, I know the Telebit Worldblazer generates noise.

My radio is sitting about 1.5 metres away from the Worldblazer, and it'll break squelch in pattern with the PEP tones handshaking. I didn't note what frequency I was on at the time.

I just found out that my keyboard at work will break squelch on my HT, 147.060. And, as I was logging off of a BBS...I set the radio down on the other side of the computer and found that the SupraFAXmodem V.32bis was causing interference on 441.975.

I would have thought the Supra to be okay considering a metal case, but I guess the front and back are plastic.

3166. Intermod/spurious sigs a common HT problem?

Newsgroup: rec.radio.amateur.misc
Date: 1993-05-26 23:43:57 UTC
From: genew@techbook.techbook.com
Message-ID: <1u0vbt$fan@techbook.techbook.com>
Source record: 280878

Thanks for the feedback on my original request. I guess I am not suprised
that a HT is a poor substitute for a true base or mobile rig. However, In
the era of President and Mr. Clinton I can't really justify buying all at
once. Maybe the true question is: Can I get by with a (W21at/TH-88a/FT-530)
until more funds are available. If I stick a 2m beam up to hit the repeater
from my house is my HT going to sound like a bad night on the
Childrens Band, aka CB, due to spurious/intermod?
Will my HT sound like a buzz saw from hell if I connect it to a external
magnetic mount antenna on my car/motorcycle?

Any experience on this?

Thank you,

Gene

>and which isn't from a manufacturer that has paid the necessary bribes.

Let's see.... 5 MHz:

I was working with the Philippine Department of Health (DOH) a few
years ago, and the Phil. 'FCC' had allocated them 4 HF freq's to use:
"five point something" (we'll call it "5.?"), 7.?, 8.?, and 10.?. I
think the original post was saying "5.?" and not "5.000000000000000".
The question was, I believe, "Where can I get radios that can channelize
to a frequency in this range?"

The answer is the Yaesu FT-580. You can contact Tony Nievera, DU1AVN,
in Manila for a source. Buy it out there and avoid having to bribe
anyone and/or pay duties. Not that I'm saying that anyone would

accept a bribe in their government. I'm just saying if you buy locally, you'll do well.

Let's see.... frown on 'non-type accepted':

There are some crimes in the Phil. that might get you killed. One of them has something to do with "salting" away US Dollars, instead of converting them to local currency! The death penalty was proposed for this (which to me, is not worth getting dead for). You might want to be *really* *REALLY* sure that if you violate the local law, especially as a non-resident, you are willing to accept the consequences. That's another reason to contact Tony, by the way. He lives there.

Hope this helps, sorry for posting it, since as I recall, the original was something like "I'm posting this for a friend using someone else's login".

Regards, and 73,
Dave

Eveready's Lithium Energizer AA cells have been on the market for a few
months. They're actually 1.6 or 1.7 volts. They last about 3 times as
long as alkalines in high current drain situations. They cost about $5
for a card of two, and have a 10-year shelf life regardless of conditions.

I'm using the tiny Comet cellular lookalike on my truck. It's short enough to allow entry into underground parking garages. It's performance on 440 is excellent, but it's not the 2 meter performer that a larger antenna would be. I used to use the Larsen dual bander, but it kept getting knocked off by those pesky low garages.

If you use mostly 2 meters, a cowl mounted 5/8 wave Larsen may be your best choice. The old Hustler bumper mounted sleeve dipole for 2 meters was nearly 8 feet high. I don't think that's a good alternative for you.

Its in the manual/Its not in the manual. Its in the manual/Its not in the manual. Its in the manual/Its not in the manual.

Perhaps those arguing this should check which version of the 202 you have.

The first one reset to 144.2Mhz but I took it back after it failed. The second one I got was straight out of the box and reset to 146.0Mhz.

I presume they revised the manual at the same time as they update the software. Hence the differing views on the "documnetedness" of this feature.

3172. MFJ-949E Deluxe 300 Watt Tuner?

Newsgroup: rec.radio.amateur.misc
Date: 1993-05-27 02:55:51 UTC
From: IQC109@uriacc.uri.edu
Message-ID: <9305270259.AA01594@ucsd.edu>
Source record: 280884

I may be considering an antenna tuner soon. The MFJ looks like a great buy since it has plenty of connections, cross-needle meter, dummy antenna, and can handle 300 watts (my Heath HW-101 only puts out 100 watts). Is the MFJ 949E a reliable unit? I'm sure someone has experience with it. Thanks for any info.

3173. Buy rig before license?..You Bet!

Newsgroup: rec.radio.amateur.misc
Date: 1993-05-27 02:59:48 UTC
From: IQC109@uriacc.uri.edu
Message-ID: <9305270309.AA02445@ucsd.edu>
Source record: 280885

It took me a full year with several false starts to get serious about obtaining a HAM license. I finally met enough nice people who encouraged me. I took the final step when I invested $20 in a novice course. I signed up for the next session (which was 6 weeks away). I spent those 6 weeks studying to make sure i didn't waste my cash! ...Then, midway through the course, the Radio Shack 10m HTX-100 went on closeout sale at $100 off! I waited a full week before ordering one. I knew that if I didn't pass my code test & theory, that radio would be worthless to me. It helped give me more incentive to get the license. I pased the novice and since then have passed tech & general. I still don't have a license (it's in the mail 5 weeks now) and have since bought a Heath HF rig at the Rochester Hoss Traders Fair. I want to be ready when that ticket arrives! I see no need to show a license to buy a rig. (NOTE: I am in the NRA and soon to be ARRL)

3174. New type of QSL?

Newsgroup: rec.radio.amateur.misc
Date: 1993-05-27 03:13:16 UTC
From: IQC109@uriacc.uri.edu
Message-ID: <9305270320.AA03121@ucsd.edu>
Source record: 280886

I have a suggestion for a different kind of QSL.
Why not scan your present card (or better still capture a video frame of youself in your shack, outside your home beside an antenna, etc.) and send the image in .GIF format on a floppy as confirmation of the contact. You could easily use a paint program to write all important info. on the QSL. Those who are slightly handy with DOS could include a Sound Blaster compatible file with a short recorded hello. Also, when requesting a QSL you could send a short recording (on disk) of your reception of the station you are sending to. Your collection of QSL "cards" could be displayed on your computer monitor as a slide show when the computer is not being used or you could use them as wallpaper in Microsoft Windows.
I realize that all of this would not work for everyone, but I bet there are many Mac & IBM Hams out there who might like to enhance their collection this way.....Comments?

> 0 1300 Hz + 1500 Hz
>

John - those are the Multi Frequency tones (MF) *not* the DTMF tones (also known as "TouchTone(tm)"). The following is from the TELECOM digest FAQ:

Q: What frequencies do touch tones use for which numbers?

A: The touch tone system uses pairs of tones to represent the various keys. There is a "low tone" and a "high tone" associated with each button (0 through 9, plus * (star) and # (octothorpe or pound symbol). The low tones vary according to what horizontal row the tone button is in, while the high tones correspond to the vertical column of the tone button.

The tones and assignments are as follows:

1 2 3 A : 697 Hz

4 5 6 B : 770 Hz
(low tones)
7 8 9 C : 852 Hz

* 0 # D : 941 Hz
---- ---- ---- ----
1209 1336 1477 1633 Hz
(high tones)

When the 4 button is pressed, the 770 Hz and 1209 Hz tones are sent together. The telephone central office will then decode the number from this pair of tones.

The tone frequencies were designed to avoid harmonics and
other problems that could arise when two tones are sent
and received. Accurate transmission from the phone and
accurate decoding on the telephone company end are important.
They may sound rather musical when dialed (and representations
of many popular tunes are possible), but they are not intended to
be so.

The tones should all be +/- 1.5% of nominal. The high frequency tone
should be at least as loud, and preferably louder than the low
frequency. It may be as much as 4 db louder. This factor is referred
to as "twist." If a Touchtone signal has +3db of twist, then the high
frequency is 3 db louder than the low frequency. Negative twist is
when the low frequency is louder.

Q: What are the A, B, C and D touch tone keys used for?
Why are they not found on touch tone phone sets?

A: These are extensions to the standard touch-tones (0-9, *, #)
which originated with the U.S. military's Autovon phone network.
The original names of these keys were FO (Flash Override),
F (Flash), I (Immediate), and P (Priority) which represented
priority levels that could establish a phone connection
with varying degrees of immediacy, killing other conversations
on the network if necessary with FO being the greatest priority,
down to P being of lesser priority. The tones are more commonly
referred to as the A, B, C and D tones respectively, and all
use a 1633 Hz as their high tone.

Nowadays, these keys/tones are mainly used in special applications
such as amateur radio repeaters for their signalling/control.
Modems and touch tone circuits tend to include the A, B, C and
D tones as well. These tones have not been used for general
public service, and it would take years before these tones could
be used in such things as customer information lines; such
services would have to be compatible with the existing 12-button
touch tone sets in any case.

>
> Erich
> N3OXM

Use MORE heat. I find a 150 Watt iron works well. With a low wattage
iron, it takes so long to heat the connector, the plastic DOES melt.

The connector is hot enough when solder begins to melt when held against
it.

Keep in mind that you're only soldering SOME of the shield to the
connector. Personally, I solder the shield to the connector at all four
holes, which also makes it more reliable in the long run.

jherndo@eis.calstate.edu (John Herndon) answers dorsey@lila.com (Bill Dorsey) question:

> I need to know the touch tone frequencies corresponding to the digits
> 0-9 and A-D for a project. Can anyone tell me what they are?

1 700 Hz + 900 Hz
2 700 Hz + 1100 Hz
3 900 Hz + 1100 Hz
4 700 Hz + 1300 Hz
5 900 Hz + 1300 Hz
6 1100 Hz + 1300 Hz
7 700 Hz + 1500 Hz
8 900 Hz + 1500 Hz
9 1100 Hz + 1500 Hz
0 1300 Hz + 1500 Hz

Nope. These tones are "MF" tones, not "DTMF" (or "touch-tone") tones. You also need 1700hz and 2600hz tones for MF, but I digress...

The tones you're looking for are:

1209 1336 1477 1633

697 1 2 3 A

770 4 5 6 B

852 7 8 9 C

941 * 0 # D

You need to generate the corresponding row & column tone simultaneously to indicate the appropriate digit.

>locked into transmit mode, yet not transmitting, could not receive anything
>on any freq (not even static if I remember what she told me correctly).
>S

Some equipment uses static ram backed up by batteries constantly to hold
some information (perhaps the frequencies in the radio, maybe the radio's
current state - i.e. TX on, PL tone, etc). I'm told that some electronic
cameras have their whole operating system in static ram with the normal
battery and a special memory backup battery in parallel - instead of an
EPROM (don't know why, so the answer must be CHEAPER. Some older ham gear
used to do that - when the backup battery failed, your rig went dead. Not
nice.) So when your fancy camera goes through the xray the film is fine but
if you lose a bit in the static ram, the cameras microprocessor goes out in
the weeds for good, or until you send to the factory to be reprogrammed.
Probably the same thing happened to your wife's ht, but fortunately the
main functions were stored in an EPROM or something that is more resistant
to soft xrays.

The mechanism as I understand it is that a bit is held as a small charge on
a tiny cap on the input of an FET. The xray just happens to pass through
the charged area, ionizing it and dissipating this tiny charge and the bit
goes to the opposite state. If it's a frequency it's a pain. But if it's an
instruction in your system code - you're dead in the water. So I don't xray
my ht's. Could probably do it a zillion times without trouble - but if it
gets hit it'll be a pain and I'll never recover the repair cost from the
airline.

I have yet to see them around in popular places in Vancouver yet, are they
available in other cities in US now? BTW, when I used to live in Southern
California, Kodak used to market their Lithium in supermarkets, but before
I bought any, they were on clearance, and then gone for ever. I still
I saw some ads on magazines as well. Now where are they? (some device would
be perfect for such a long shell life, and high cap. type!)

How much are the AA Lithiums?

One hundred years ago (at least), when I was studying Elec. Engrg., I had to take one course in Civil Engrg. to "learn" something about structures. About the only thing I remember is that one never uses guy wires on a cantilever (self-supporting) structure. The reason is that one will fail before the other does any good.

Which one, the structure or the guys, fails first is very difficult to calculate but intuitively you can see that in a strong wind the guys will probably "stretch" far enough before hitting their elastic limit that the tower legs will collapse unless you put a great deal of tension on them when you first put them up. If you do that, you are pre-loading the legs which will make them more likely to fail.

3185. IC 271/471 vs IC 275/475 Performance Question

Newsgroup: rec.radio.amateur.misc
Date: 1993-05-27 10:33:53 UTC
From: seeler@UPEI.CA
Message-ID: <seeler.17.738498832@UPEI.CA>
Source record: 280907

Just a quick note to ask your opinion about the performance of the IC 271/471 radio pair versus the more recent models - the IC 275 and IC 475. My interest relates to the fact that there are published mods for the 271 and 471 for use with 9.6 Kb packet. The 275 and 475 have received good reviews in the past for general as well as satellite operations.

Can the same be said of the earlier pair?

Thank you for your consideration of this request.

Message-ID: <199305271946.AA06925@postoffice.mail.cornell.edu>
Source record: 280935

I agree, the security people - who realistically are mostly there for show - only know what they were told, "It won't hurt anything", and that is usually their stand. With my electronics, I usually aim for a quiet time, put it all aside in the hand inspect pile, and be as friendly and helpful in offering to demo it as I can. Usually works. WHen they say "It won't hurt the film" for the camera, I tell them I know that, but it will hurt the electronics - I used to be a failure analysis dude. Sometimes they just accept that (s'truth) and we man handle the gear until they are satisfied. Once or twice I have had to say "Look, we can take the friggin' thing apart with a screwdriver till you're satisfied it's what it purports to be, but an xray may kill it." and they were willing to peer inside the case. I don't think that will work many places, especially when busy, but I fly from a cow country airport where things are slow, and once I'm inside the gate here, I don't go outside the 'sanitized' areas in the hub airports.

I don't know what I'll do if push comes to shove someday. Probably just let them xray it, although if I had the time I might try to take it up a level or two. I do appreciate the effort to keep airplanes from going boom. But I really wish they would do it effectively instead of stupidly, by rote, and like a sieve. The FAA runs about 100 firearms through carry on luggage a year to check the system. They were getting a typical hit rate of about 3 percent last I read. Good security costs though. :-(

I believe all checked luggage gets solidly xrayed (though who knows if anyone looks at it) so don't put my electronics in there. Mostly its a computer, an ht, and sometimes a modem or qrp rig, all in one carry on. They recognise ht's and computers (though it would be trivial to make a nasty box that behaved like one) so there's not much problem with them. Anything weird they seem to want to run through the xray as if that will somehow 'decontaminate it'. Kinda funny, if it weren't so sad...

>magnetic mount antenna on my car/motorcycle?

At the end of Billary's single term, your money will be worth less, everything will cost more, and you'll be making less if you're lucky enough to be employed. Buy now while you can.

Now on to the technical question. The answer, like most things, is that "it depends." IE not near a major urban area, then the HT will likely be fine. On the other hand, if you do live in a congested high RF area, it will truly suck. Your best course is to buy the HT from a dealer who will exchange it for a mobile rig if there's a problem.

3189. ft530 rubber resistor: tuned low?

Newsgroup: rec.radio.amateur.misc
Date: 1993-05-27 11:42:56 UTC
From: znha@ve3ppe.isis.org
Message-ID: <C7ooJL.38t@ve3ppe.isis.org>
Source record: 280857

I had the pleasure yesterday of using the company's network analyser, (1) for a few minutes. The ft530 (2) and it's factory rubber resistor were with me, so I plunked it on.

Spread 100MHz to 500MHz. Log Magnitude. Return loss mode, a (s1) channel.

The antenna varied between free-standing and held, touching the ht's BNC where it would be naturally. Dips of maximum return loss (3) were at 140MHz +-2MHz, and 410MHz +-3Mhz. Depth around 147 and 448 MHz were only roughly -3 dB instead of -12 to -18 dB.

Yaesu tuned their rubber duck intentionally low in frequency?

Can't be. Must be a matching network in the radio. Plug the network analyser into the BNC on the ht, turned on (avoid ptt!). Hey, it's dips are roughly in the same area, although they are much broader, and the uhf dip goes from roughly low 400s to high 400s of MHz. Looks like yes, virginia, the (or my) system is tuned low, and the antenna has to be a rotten performer!

Comments from others having played with antennas, ducks and analysers?

73, Gord.
znha@ve3ppe.isis.org (internet) ve3ppe@ve3osq.#eont.ca.na (packet)

(1) we're missing one of the adapter plugs off of the s2 port. Apparently they're about $250 to buy from HP...anyone selling theirs cheap?

(2) Gary: love the clock--used it as a travel alarm at Dayton 8-)

(3) return loss examines the amount signal that (doesn't) come back. Ideally, a perfectly matched system, perfectly coupled will return nothing--all of the signal is radiated and nothing ever comes back. A -3 dB dip means that half of the signal transmitted radiated (or: went into heat) it didn't come back, and the other half DID. -10 dB dip means, for 3W incident, 2.7W went somewhere, never to return (hopefully radiated) and 0.3W was reflected.

3190. WANTED: NOAA/SAT INFO

Newsgroup: rec.radio.amateur.misc
Date: 1993-05-27 12:02:17 UTC
From: MOWE%SLUMUS.BITNET@cunyvm.cuny.edu
Message-ID: <27MAY93.08681323.0011.MUSIC@SLUMUS>
Source record: 280909

In a recent positing, John Herndon asked about NOAA satellite
frequencies, formats, and tracking.

John, the most comprehensive single source for current weather
satellite information is Weather Satellite Report, a bi-monthly
journal. A sample copy may be requested from the publisher,
R. Myers Communications, P.O. Box 17108, Fountain Hills, AZ,
85269-7108; voice 602-837-6492; FAX 602-837-6872.

Several satellite tracking programs are available for determining
positions of the satellites in real time. All of them can track
multiple satellites on a text screen. If you want to see multiple
satellites on a map, try RealTrak; it can show up to 6 satellites
with their "footprints" (areas of coverage)
at a time on its Mercator projection. For address/telephone, see
below :)

I support the satellite tracking and acquisition software here. We currently receive data from NOAA 11 and 12. NOAA 9 and 10 are still flying but I believe that both have experienced some problems and are no longer used - although I suspect that live transmissions are still working. The record and playback functionality seems like it's the first thing to fail - or to get shut down due to power problems.

HRPT is the type of data which most people are interested in. LAC refers to HRPT data which is captured on tape over remote parts of the world and then played back when it comes back around. GAC data is also recorded but the path is longer and narrower than HRPT or GAC. Since most people do not have access to the recorder schedules, live HRPT is the most popular. We have the capability to receive all three - but LAC and GAC are relayed to us by NOAA. We do not currently capture GAC. We also have a cooperative project with many other tracking stations worldwide in order to get daily global land coverage of AVHRR data.

Looking in the owners manual, the HRPT downlink frequency is either 1698, 1707 or 1702.5 Mhz. The 1702.5 is only used in case of the failure of the primary transmitters.

In order to track several satellites at once, you would need multiple antennas, receivers, frame & bit synchronizers and interface boards. We do receive up to two at once - but one is actually tracked while the other is relayed to us from NOAA via a stationary relay satellite. Our tracking

is done by known path, not by signal - so timing is very important. Due to this and the fact that the onboard clocks are often off by up to two seconds, we also have an NBS time receiver which we poll at the beginning of each pass in order to determine the time correction to be applied to each data line. We save these delta corrections in a file so that we can later correct recorded data relayed by NOAA and our cooperators.

Other satellites that are up there are SPOT, LANDSAT and GOES. We are a national archive for Landsat data and are slated to be the archive and distribution site for Landsat VII. SPOT is a French satellite which we do not use. GOES satellites are geostationary weather satellites that offer very wide coverage - you can actually see the entire globe. The NASA EOS project will drastically increase the quality and quantity of remote sensing data - and we will be involved in that project as well. There's a lot up there with a lot more to come. Bye...

My bride, N4AFG, tells me that ice ain't required for a good (or bad! ;^)
response from a microwave. She claims some very VERY exciting things
happen if you forget to puncture a potato(e) while "micro-baking"!

Seems as though perhaps Brussel Sprouts and Baked Potato(e)s would
make good substitutes for the PCBs in tranformer oil for use in dummy
loads... ;^) ;^)

>--
>I am just getting started in Ham radio and have a question regarding mobile
>antennas. I am looking for ideas on what type of mobile dual band (2M/70CM)
>antenna to use on my Dodge Caravan - given that it must clear a garage door
>daily (with about 16" clearance). Would a 5/8 wave cowl mount be best or
>would a bumber/tailgate mount be good. Could anyone with a Caravan/Voyager
>comment on how they resolved this? I plan on using the antenna for my HT
>until I buy a dual band mobile rig. Most of my travel is on the plains of
>South Dakota and Minnesota. Thanks...

If you could drop your suspension 3" or let some air out of your tires ;-),
you could use the Austin 500C... it's about 19" high. It's somewhat
flexible, but you probably wouldn't want to run it into your garage every
night if the clearance is 3" too low.

So, this isn't quite what Tom was asking for. Regardless, I wanted a chance
to comment on the Austin anyway. It's under $30, and quite a few of the guys
in our radio club have them and we all like them very much. Mine does not
approach the 2m 5/8 mag-mount in effectiveness, but it's much better than my
old 2m 1/4 wave mag-mount and much, MUCH better than my old 2m/70cm cellular-
look mag-mount. I've got it on an NMO mount through the center of the roof.

When I was looking for a mobile dual-band antenna, some of the guys in my
other radio club said the Maxrad was definitely the way to go. Well, I bought
the Austin anyway and the other day got a chance to compare the two from the
same antenna mount. The Maxrad is, I seem to remember, about 5" longer than
the Austin 500C; I brought up a moderately distant 2m repeater with each
antenna and the Maxrad showed a received signal strength of about 2 s-units
more than the Austin. However, when I brought up a moderately distant 440
repeater, the Austin showed about 6 s-units stronger a signal than the Maxrad.
Given the Austin's shorter length and its still quite effective 2m range,
I think the higher apparent gain on 440 makes the Austin a better deal for
anyone who works 440 mobile (I think the Maxrad goes for well over $50).
Mine came perfectly tuned for 2m out of the box, with a very low SWR across
the entire band. I don't have a meter that will measure SWR at 440MHz, but
if I get the chance to check it and find it less than satisfactory I'll post
that information.

Tom, you may want to look into the Comet and Diamond antennas. One of them
(I forget which) makes almost all their mobile antennas with a joint near
the base that can be folded over for getting under low overhangs.

--
The problem - especially in international airports is that the bozos who
run the x-ray gear have absolutely no concept of what it can do even though
they claim to be experts - and they have the final say on whether you can

hand off a piece of equipment rather than x-ray it. Their standard answer for cameras is "won't hurt it" but it will fog film of ASA 1000 or higher - some airports have finally admitted this and put up signs to that effect. I am not confident that any airport security personell really understand or care about what can happen to electronic equipment. Anybody have any ideas how best to handle this when you are trying to catch your flight? I can appreciate their efforts to keep planes from going boom, but their actions can be costly. I WILL not put my electronic gear in checked luggage - which I suspect gets x-rayed anyway. Bye...

OOOHHHHH! That GETS me something AWFUL! I don't know if the ARRL VEC
has brought ALL novice testing under the program, but:

I am a W5YI-VE, and I have done about 75 testing sessions, about 5 of
which were with the Laurel (MD) VEC, which gives all exams for free.

W5YI charges for exams, but NEVER for Novice exams (implying elements
1A - 5 wpm, and 2 - Novice written exam). If somebody fails the NOVICE
portion of the test, they should in no way be charged to retake it -
they shouldn't even be charged in the first place, as (I say again)

THE NOVICE TEST IS STILL DEFINED AS A FREE EXAM

because it can still (or could until recently) be given by NON-VE's,
who can't exactly charge.

Just 'cause one PLANS to take the Tech. test, and they fail the NOVICE
exam on the way, there is no way that they should be double-charged.

In fact, W5YI allows its VE's to give ONE FREE RETEST of ANY failed
element, at the discretion of the Examining Group. Not sure if that's
a free retest per element or per Exam Session, but the provision is
definitely there.

It is the policy of most VECs to charge for re-testing of the same element.
However, the one exception for Novice elements. The information here relates
to the ARRL VEC, others might be different.

1) If a candidate comes to take Novice written and/or 5wpm, there is NO CHARGE.
Furthermore, there is NO CHARGE to re-take Novice written (2) or 5wpm
(1a) any number of times.

2) If after passing element 2, the candidate wants to take Tech written
(3a) the candidate must pay $5.60. If the candidate fails 3a and wants
to re-take 3a again, he must pay another $5.60 etc...

3) The one exception RIGHT NOW is that if a no-code tech comes and wants to
take 5wpm to upgrade to tech+ (btw I hate that designator), he must pay
$5.60 even though he is just taking a Novice element. This will change
on July 1 for ARRL VE teams and there will be NO CHARGE for this either.

Bottom line, your girlfriend should NOT have had to pay $5.60 to re-take the Novice written. If she passed Tech written on the first attempt, then the total cost should have been $5.60 (for the Tech written 3a). If she paid more, contact the VE Team and tell them to learn the rules by calling the ARRL VEC Office at (800)927-7583. If you have trouble with the team, call them yourself to inquire about a refund.

|> this way.....Comments?

That's a good, but we need to get away from the "sneaker net" idea and think in terms of network picture exchanges. Down with the floppy! Pretty soon
data networks will be used not only for data exchange but also for software
distribution and even backups. How about this:
Write a program that will prompt you for the other station's data, (including E-Mail address) and will superimpose it on an image of your shack (or whatever). It then compresses it (JPEG) and sends it out as an
E-mail message. Of course, if you have a Mac, you can use Quicktime with
MPEG and you can even send a little motion video sequence.

BTW this system would also provide real-time automatic logging.

What data network? you say. Well, I didn't mention WHEN this would be possible....

>You've just done everything you can do. Relax and let it go at that.

The above paragraph gives lots of good advice. Use the attenuator on
loud stations. Also make sure your noise blanker is turned off. Most
blankers cause splatter, in your receiver, from loud stations that are
much more than three kHz away.

3213. Re: Balanced feedline (was:G5RV)

Newsgroup: rec.radio.amateur.misc
Date: 1993-05-27 18:25:37 UTC
From: mbutts@mbutts.mentorg.com
Message-ID: <1993May27.182537.22611@news.mentorg.com>
Source record: 280930

Thanks to all who have posted and emailed me on this. I think I'm converging onto center-fed flattop with balanced 450-ohm ladder line all the way down to my tuner.

Howard Lester suggested using PVC pipe instead of dryer vent for the feed through the wall, and using slotted and sealed PVC end caps rather than foam. Sounds good to me. My shack (walk-in-closet) has no window, and I own the wall.

My question is how long to make the flattop. Zack Lau at ARRL says 86 feet is a 'magic' length good for 20 meters. Gary Coffman says 105 feet is a 'classic' length for a center-fed flattop. Why? I don't see the wavelength relationships for either.

Also, if the feedline is balanced and I'm using a balanced tuner, does the feedline length really matter, as some seem to think? Or does it only matter if the feed or match is unbalanced.

By the way, my tuner's schematic (AEA Econotuner) shows a center-tap-grounded inductor with the balanced feedline across the whole thing and the single-ended connection to the rest of the tuner and rig connected to one end.

Thanks again and 73 de KC7IT.

> Is the MFJ 949E a reliable unit? I'm sure someone has experience with it.
> Thanks for any info.

HAHAHAHAHAHAHAHA! Oh, sorry.... I have the 948 tuner, which is the same unit without the dummy load. Sometimes I think *I* was the dummy to buy this. Actually, I find the unit works well unless loading it with a very high impedance. In those conditions, the balun heats up and the swr climbs, even with 50 watts. What is considered a high impedance in this case? That's for me to know...and for you to find out.

I'm in the process of building a new balun (a heftier one) to replace the one inside the unit. In order to get a handle on what kind of material to get for the core, I phoned MFJ. The fellow didn't seem to know (or care) what it is, other than a "standard red". "Mine's gray...." I replied. "Is there any way to find out what it is?" "You'd have to ask the engineer who designed it, and there's no telling what state he's in by now.....We contract these out, and it's up to whoever builds them...."
He seemed unable to tell me. He DID say that the core is just a "standard red". I said "Mine is gray". "Is there any way to find out?" "You'd have to ask the

Has anyone got any recommended values for charging current for a DJ580?
I am intending to take mine on a camping holiday and as mains electricity is not often found in convenient places in a tent, it would be nice to put together a simple charger to run off the 12V car battery. The pack I have on the rig is the 7.2V 700mAH variety, although figures for all sizes would be useful.

Has anybody else received a chain letter asking that $1 be sent
to the first name and put yours last etc etc?
The letter starts off "Hello, my name is David Ross",
and the number 1 name is James Dibley of Muncie IN
with a PO box address. nrs 2-5 have street addresses.
With it were some "endorsement" letters.

I suspect a scam because the way it was addressed contains an error,
and the only place where my address contains that error is my amateur
radio license.

I called the local postal inspectors, and they are interested. I am sending
the letter and envelope to them.

I used to do something like this years ago when I parked my car in a garage. I was using a trunk mounted 5/8 wave at the time. It would flex over and the upper few inches would rub against the garage door. No problem. It worked great 99.999999% of the time --- until one day the end of the wip decided to get caught in the garage door lock mechanism. It sort of pulled the base of the 5/8 wave apart as I backed out that day. Luckily I was able to put everything back together.

NO PROBLEM. I have a Chevy Full size Blazer that I park in a garage daily.
Sitting on top is an Austin 500C dual band antenna. Every morning I back
out of the garage. The antenna makes noise as it brushes against the door
and then again as it goes by the wooden door frame. Every evening I do
the opposite. I've been doing this daily for 2 years now. No problems
with the Austin. From the top of my Blazer to the wooden garage door
frame I have 7 inches of clearance. I wouldn't worry in the least about
a 16 inch clearance. Wish I had that much. The 500C has a spring loaded
base that allows all of this to happen.

>
>So, this isn't quite what Tom was asking for. Regardless, I wanted a chance

>

Another ham in the office did a similar comparison and had similar results.
The performance vs dollar value is clearly with the Austin. IMHO

>Tom, you may want to look into the Comet and Diamond antennas. One of them
>(I forget which) makes almost all their mobile antennas with a joint near.
>the base that can be folded over for getting under low overhangs.

Not sure on Comet but Diamond has the fold over. With my 7 inch clearance
I didn't feel comfortable with the remaining height of the foldover.
16 inches shouldn't be bad. But who wants to keep getting out of the
vehicle before the garage just to fold it over?

Best of luck finding the antenna best for your application

KD1ON, your information is incorrect. There is NO fee for retesting for
a NOVICE level examination by any ARRL VE Team with the exception of one
who is a No-Code Technician who takes 1a to become a Technician w/HF.
That charge will also be waived after the Novice testing is rolled into
the VE Program on July 1.

You are correct about the re-examination being at the discretion of the
VE Team. Field Stocked VE Teams have 4 versions of the cw exams and 6
versions of the written, so that usually isn't the problem. Time is.

3225. Info needed on some military receivers

Newsgroup: rec.radio.amateur.misc
Date: 1993-05-27 20:07:36 UTC
From: keith@radio.nl.nuwc.navy.mil
Message-ID: <1067@radio.nl.nuwc.navy.mil>
Source record: 280850

I'm familiar with the typical R390's, R388's and receivers of that class
that show up from time to time, but I've run across some receivers that
I could use some info on:

R1279D (covers 30-300MHz) <-- I may have these first 2 reversed
R1401A/G (covers 1-600kHz)
CV1750/U (frequency converter - appears to cover 225-1000MHz)

Does anybody have some more info on these? They appear to be well built,
perhaps 70's vintage? What do they usually sell for?

Thanks in advance,
Keith Kanoun, WA2Q

This is a strange tower. Rohn states it is rated for a maximum 10' boom.
I considered one but was talked out of it by several hams whose opinions
I respect. I don't have experience with one, but be SURE to get an up
close look at one before you invest. I saw one and the members don't
even look sturdy enough to trust climbing. The price is nice though.

Be sure to check out the Rohn Engineering Catalog for the 10' rule.
What you don't want is for it to come down then have your insurance
company find out you "overloaded" it by putting any HF yagi on it.
Unless you put a quad up, you will be hard pressed to find HF antennas
with than a 10' boom.

>I got from the US Govt (not a copyright violation)?

Even if it were known that you got this out of the Callbook, I
believe that common sense would allow this to fall under "Fair Use".
doctrine. Even copying one page could probably fall under the same
situation, especially since this is the typical minimum copy size.

Now copying all of the 'F' pages would probably cross this line
and could be considered denying revenue to the copyright holder of
the Callbook (RCBA). Though building up the same info from the
electronic sources would be quite correct. This denial of revenue
is usually where the copyright holder can get the most amount of
monetary compensation from the violation.

3230. VCO design questions

Newsgroup: rec.radio.amateur.misc
Date: 1993-05-27 21:34:37 UTC
From: cheech@med.unc.edu
Message-ID: <1u3c5d$8t9@samba.oit.unc.edu>
Source record: 280939

Greetings,

I have a couple of (simple-minded?) questions about VCO design for
PLL synthesizers. Since the Engineering library is an hour away and
you can buy a lot of parts for the cost of one specialist publication,
I'm asking the group for information.

1) Many of the PLL designs that I see use a common-gate FET oscillator
for the VCO. The reason given is that the phase noise is lower for
this configuration. No one explains why the common-gate oscillator
exhibits lower phase noise. Can anyone enlighten me?

2) I haven't found a discussion of common-gate oscillator design in
my (not that large) set of references. Is it so simple everyone
else knows how to do it? More enlightenment, please.

3) Most of the VCO designs use varactors in a back-to-back setup,
paralleling pairs of back-to-back varactors to get higher
capacitance. What am I missing here? Does this contribute
to stability or is there another reason for it?

All information will be appreciated. Suggestions for specific
books or articles to read will make life easier if I have to make
a trip to the engineering library. A good explanation may save me
a trip to the library.

Thanks,

Greg AC4YT

2ND CALL FOR VOTES
AND VOTE ACK
REC.RADIO.AMATEUR REORGANIZATION

This is the 2nd official Call for Votes for the reorganization of the
rec.radio.amateur hierarchy of newsgroups. The first CFV was posted May 10th.
This vote is being conducted according to the official newsgroup creation
procedures, which are posted regularly in news.groups.

Votes may be cast only with the simple fill-in-the-blanks form which appears
in the "HOW TO CAST YOUR VOTE" section later in this CFV.

An acknowledgement for votes received ("vote ack") is included near the end
of this article.

SUBJECT OF VOTE
---------------
All of the newsgroups proposed below are UNMODERATED.

rec.radio.amateur.digital.misc
amateur packet radio, RTTY, AMTOR, Clover and other digital amateur
radio modes (This replaces rec.radio.amateur.packet and adds other
digital modes to the subject)

rec.radio.amateur.digital.tcp-ip
TCP/IP via amateur packet radio

rec.radio.amateur.dx
DX (long distance) amateur radio communications

rec.radio.amateur.antenna
amateur radio antennas: theory, techniques and construction

rec.radio.amateur.equipment
amateur radio equipment: manufactured products and modifications

rec.radio.amateur.instruction
amateur radio instruction & examination

rec.radio.amateur.operating
amateur radio operating procedures and techniques

rec.radio.amateur.homebrew
amateur radio construction & experimentation
```

rec.radio.amateur.space
amateur radio in space: amateur radio satellites, earth-moon-earth (EME) communications, space shuttle, MIR space station, etc.

rec.radio.amateur.emerg-services
emergency services: RACES, ARES, NTS, and other use of amateur radio in emergencies or disasters

rec.radio.amateur.rdf
radio direction finding: recreational hunts and searches for interference

Two existing newsgroups will not be affected by this vote. They are rec.radio.amateur.misc and rec.radio.amateur.policy. They do not appear on the voting form and no changes resulting from this procedure will apply to them. rec.radio.amateur.digital.misc will replace rec.radio.amateur.packet if it passes, otherwise rec.radio.amateur.packet will remain unchanged.

DURATION OF VOTE

Voting commenced when the 1st official CFV was posted on 10 May 1993. It will continue until 9 June 1993 at 23:59PM UTC.

Voting procedures are detailed in the next section, "HOW TO CAST YOUR VOTE."

Upon completion of the voting period, the results will be posted to news.announce.newgroups, news.groups, rec.radio.info and all the current rec.radio.amateur.* newsgroups. In order to pass, newsgroups must have at least a 2/3 majority of YES votes and at least 100 more YES than NO votes.

HOW TO CAST YOUR VOTE

Jay Maynard, K5ZC, is serving as vote-taker for this vote. Please REPLY to this message via MAIL to his account, jmaynard@oac.hsc.uth.tmc.edu; using your newsreader's "mail a reply" command on this message should work. Posted votes can not be counted. You will receive a reply within a few days after your votes are received which indicates how the vote counting software thinks you voted - please mail corrections immediately.

PLEASE USE THE FORM AS IT IS. The vote-taker requests that voters cut out the rest of the CFV besides the form from their replies so the saved votes won't take so much storage.

Please do not delete anything between the "-=-=-=-=-" lines - and most certainly do not modify the group names. Votes will be tallied by an automatic program and if it can't determine your vote you will be asked to re-vote.

For each group that you wish to vote on, simply add your vote in the appropriate space on the same line. Recognized votes are Yes, No, For, and Against. Yes and For are equivalent, as are No and Against. Capitalization is not important. If you want to abstain from voting on a particular group, just leave the space blank. Don't worry about spacing of the columns or any quote characters ">" that your reply inserts.

You may _NOT_ do a combined vote - i.e., "I vote for all of them" or "I vote against all of them." Please use the form.

You may only vote once, regardless of how many accounts you may have. Forwarded or proxy votes are invalid.

Reminder - don't delete anything between the lines below. But please remove the rest of the CFV from your reply.
